May 11, 2017

The weather radars (WSR-88D) used by the [National Weather Service Forecast Office in Burlington, VT](#) will be down for approximately four days for technicians to install an important technological upgrade. The work on the WSR-88D has been scheduled to minimize any potential impacts to office operations and will be delayed if hazardous weather is forecast.

The [WSR-88D at Ft. Drum, NY](#) will be unavailable from approximately Monday May 15, 2017 through Thursday May 18, 2017.

The [WSR-88D at Burlington, VT](#) will be unavailable from approximately Tuesday May 23, 2017 through Friday May 26, 2017.

During the outage, radar coverage is available from adjacent radar sites including [Albany](#) and [Buffalo, NY](#), and [Gray, ME](#).

A crew will install a new signal processor, which replaces obsolete technology, improves processing speed and data quality, provides added functionality, and supports IT security.

This is the first of four major upgrades, known as service life extension projects, planned in the next five years to replace and refurbish major components of the 20 year old WSR-88Ds and to keep the radars operational into the 2030s. The \$150M investment is being made by the three organizations that use these radars, the NOAA National Weather Service, United States Air Force and Federal Aviation Administration. The other service life extension projects include refurbishing the transmitter, pedestal, and equipment shelters.

The tri-agency [Radar Operations Center](#), which supports the radars, estimates it will take about 10 months to upgrade the signal processor on all 159 operational WSR-88Ds.
