## **February 27, 2011**

Another round of severe thunderstorms occurred Sunday night, producing scattered reports of wind damage. Pockets of major wind damage and a few possible tornadoes occurred in southern Illinois and southwest Indiana. National Weather Service damage survey teams will investigate areas of Gibson and Pike Counties in Indiana and Wayne County, Illinois. Damage in those areas consisted of moderate to severe damage to structures, particularly near Orchardville, IL and Owensville and Oakland City, IN. Elsewhere, some isolated damage to trees and weak structures such as barns and trailers occurred in western Kentucky and southeast Missouri. The damage was the result of a line of thunderstorms that contained embedded bowing line segments.

A survey team from the Paducah National Weather Service Office confirmed 3 tornadoes hit southwest Indiana during the early morning hours of February 28. The strongest has been rated EF2 and caused damage in Oakland City. Full details of each tornado follows below.
