

# ATM-480 Lecture: Hydrology in the National Weather Service

Britt Westergard  
Senior Service Hydrologist  
NWS @Albany, NY

# Water flows downhill.

Any questions?

# Hydrology in the National Weather Service

- Why NWS forecasts rivers & what causes flooding in the Albany NWS forecast area
- Fundamentals of hydrologic modeling
- NWS flood forecasts & warnings
- The future of NWS hydrology

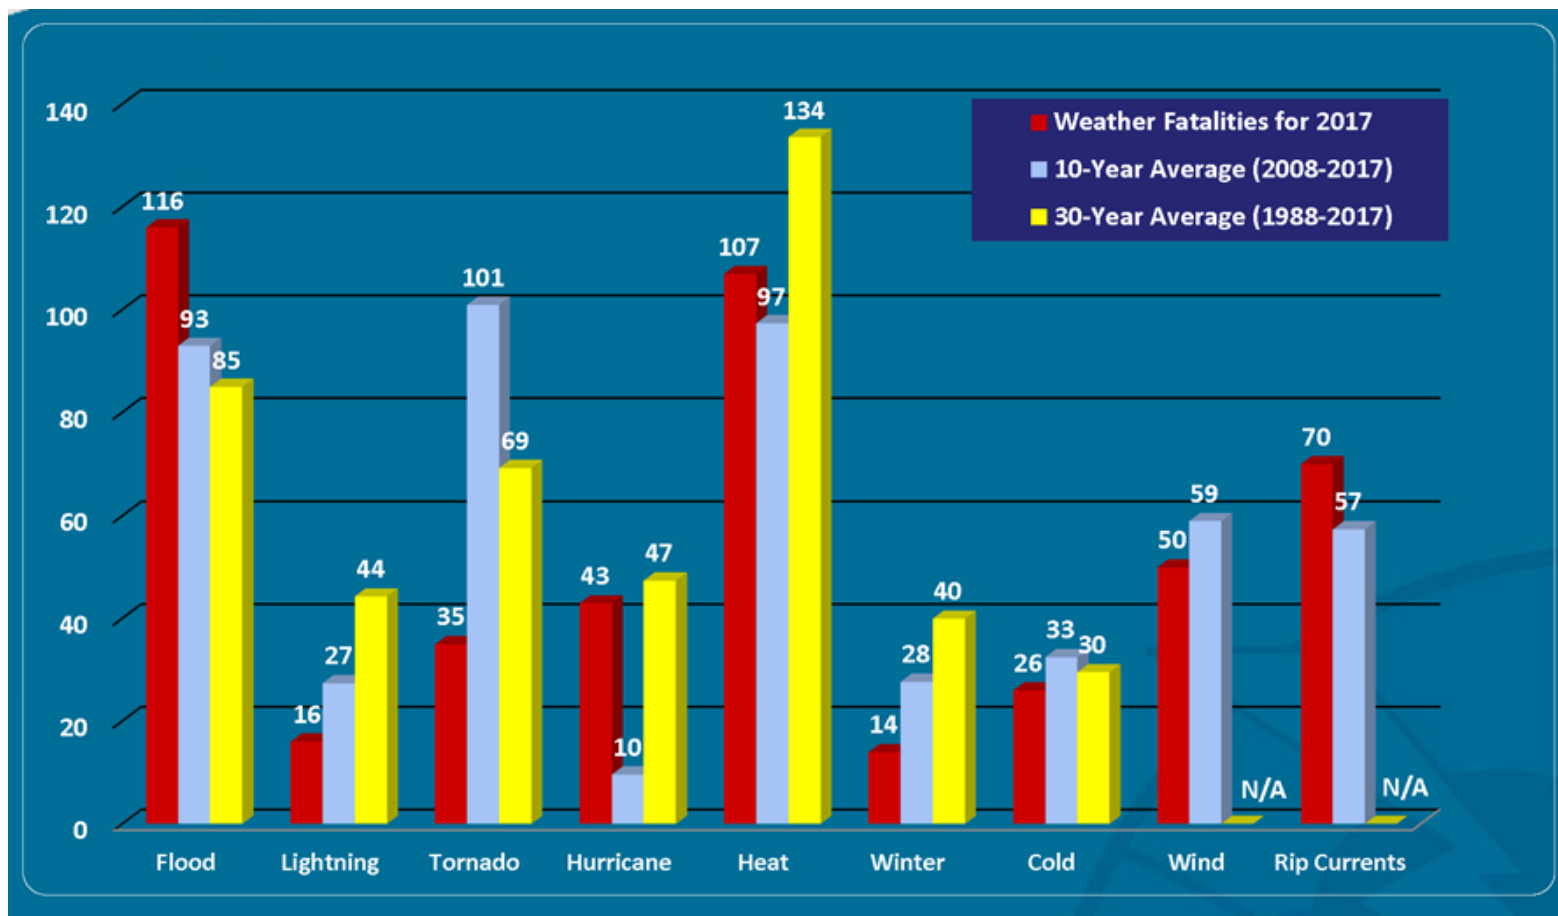

# Why Forecast Rivers?

- Protection of life and property
  - Each year, countless lives are saved due to accurate forecasts of rising rivers
  - Millions of dollars in property are also saved by accurate forecasts
- For Hydro Power Production/Industry
- Recreation
- Dam Operations
- Navigation

The National Weather Bureau Organic Act of 1890 (U.S. Code title 15, section 311) mandates that the National Weather Service is the responsible agent for *"the forecasting of weather, the issue of storm warnings, the display of weather and flood signals for the benefit of agriculture."*

# Flooding is the #1 Severe Weather Hazard in U.S.

About three quarters of federally declared disasters in NYS are flood-related

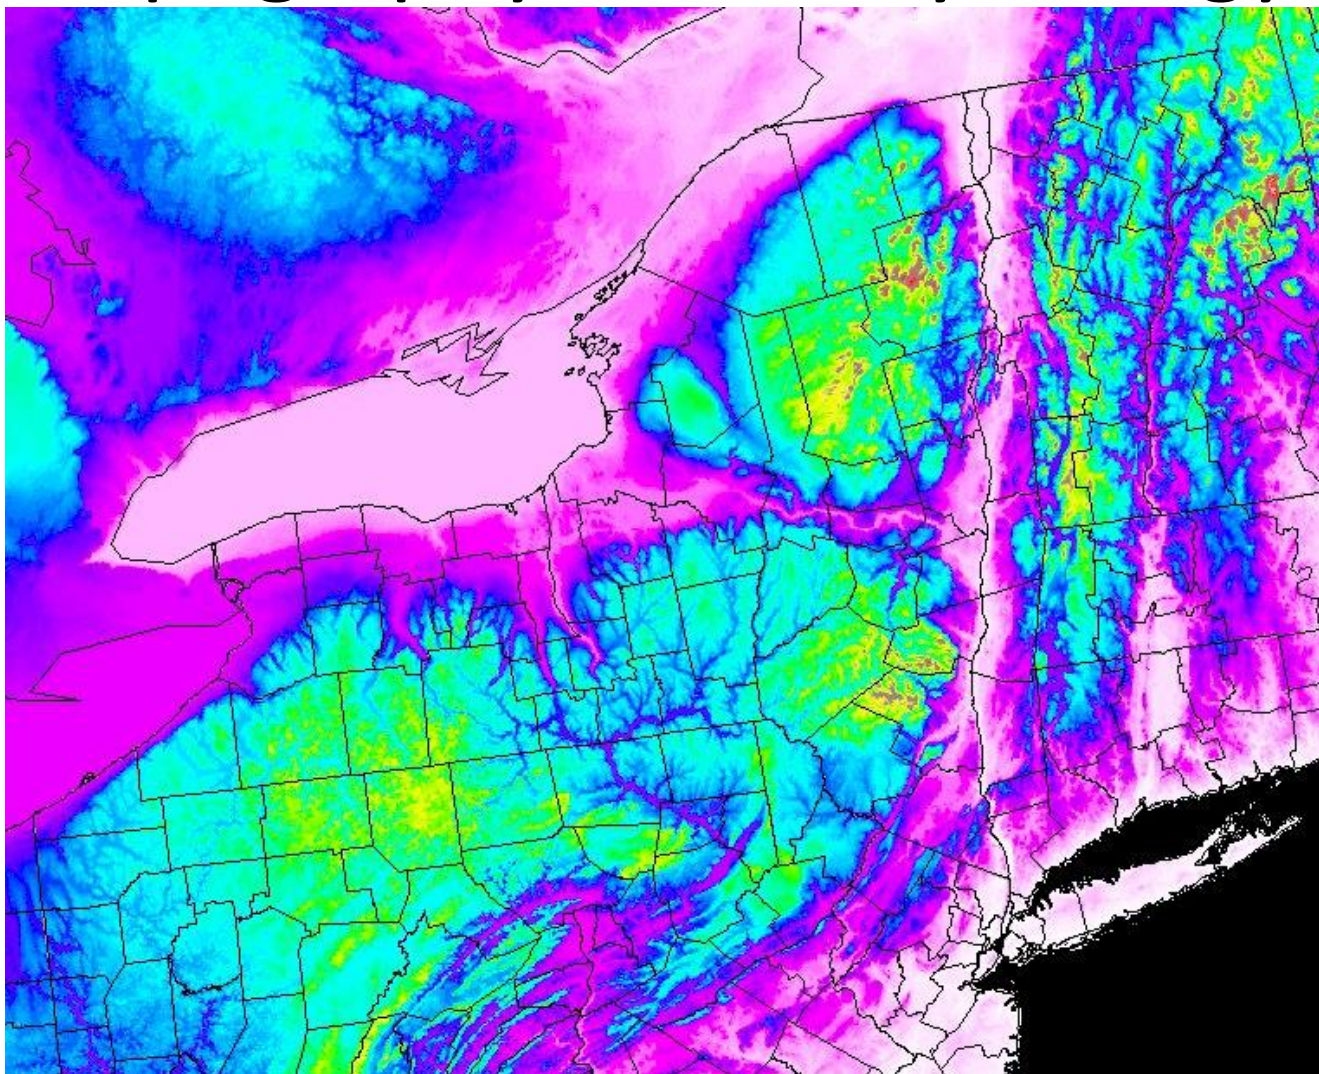

# Common Causes of Northeast Floods

- Floods can occur any time of year:
  - Winter/Spring –
    - Rain plus snowmelt
    - Heavy rain with large storm systems
  - Spring/Summer - Thunderstorms
  - Summer/Fall - Tropical Storms

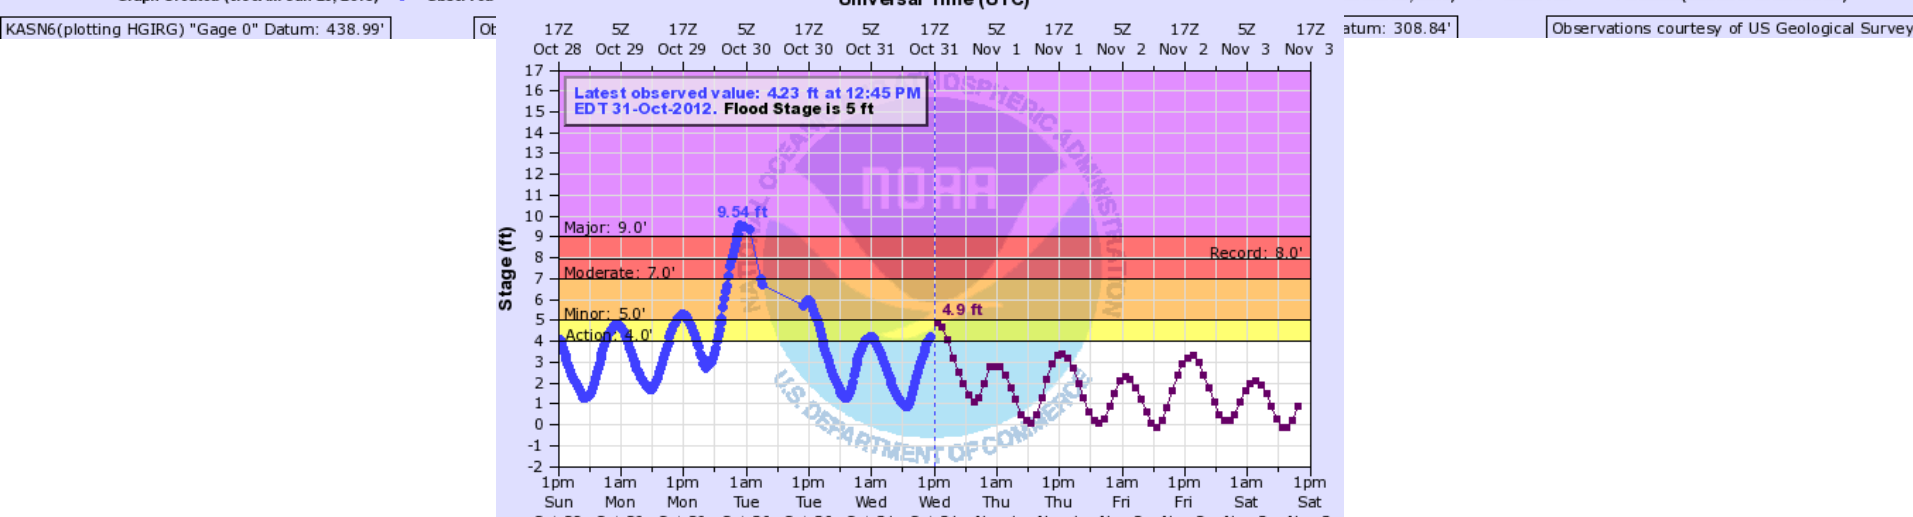

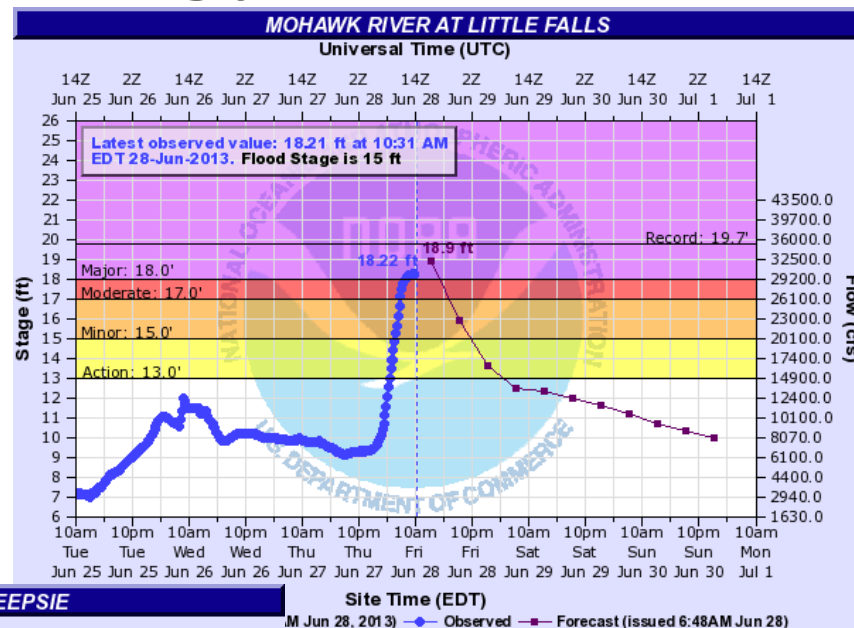

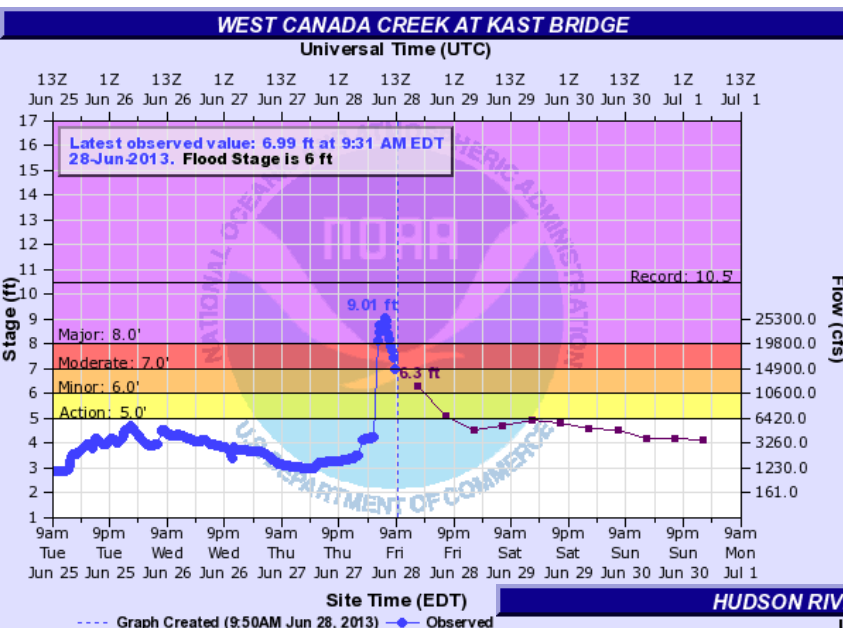

# Topography drives Hydrology

# Varied Topography makes for Varied Hydrology

# Antecedent Conditions

- How dry or wet is the soil?
  - Wet soils increase runoff
  - Dry ground can absorb rainfall and decrease runoff
- Is the ground frozen?
  - Frozen ground reduces infiltration of rainfall into ground (increases runoff)
  - Large increase in urban/basement flooding when heavy rain or snow melt on frozen/partially frozen ground
  - Mud slides possible in steep terrain during thaws
- Late Spring/Summer vs. Late Fall/Winter
  - Trees/plants/crops absorb a significant portion of total rainfall when leaves are on trees

# Antecedent Conditions:

## Is there any **snow melt** or river ice?

Heavy rain + warm temperatures + strong wind + large snow pack + river ice can be a deadly combination

January 1996

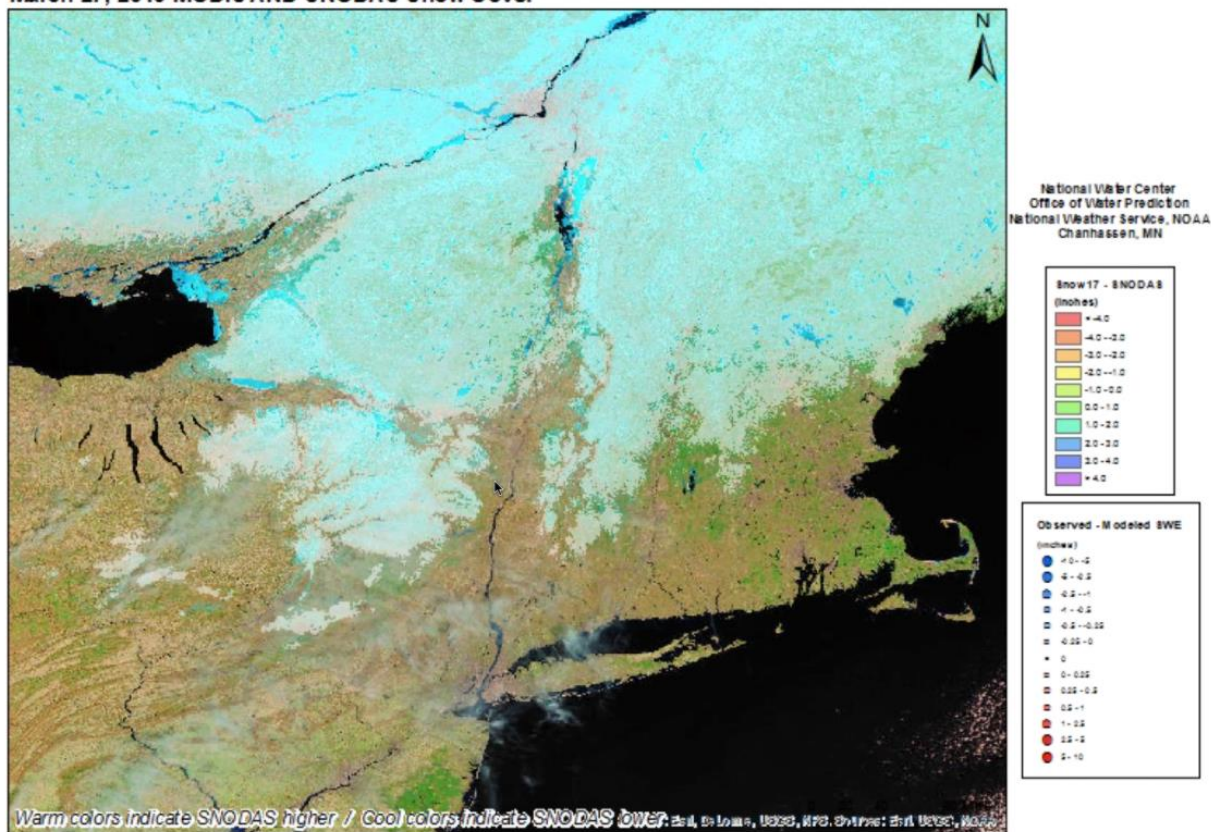

# Monitoring Snowpack

(Snow17-SNODAS) Basin Average SWE : Eastern Region  
Observed - Modeled SNODAS SWE

Top Value SNODAS BASIN SWE  
Bottom Value SNOW17 BASIN SWE

March 27, 2019 MODIS AND SNODAS Snow Cover

BLUE values OBSERVED SWE

National Operational Hydrologic Remote Sensing Center (NOHRSC)

# River Ice Jams

Ice Jam Breaking Along the Mohawk River in Rotterdam Junction NY.

North Creek Bridge : the road on the top left is Old River Road, which was under 3 – 4' of water in the low areas at time of photo, March 2011; photo courtesy of Warren County Emergency Management

Looking northwest at the North Creek Bridge, March 2011; photo courtesy of Warren County Emergency Management

# River Ice Jams

- River rise needs to be about 3 times the thickness of the river ice to break up the ice
- So...ice a foot thick needs about a 3 foot rise in stream level to break up the ice
- Ice jams cause localized flooding and can quickly cause serious problems
- Rapid rises behind the jams can lead to temporary lakes and flooding of homes and roads along rivers
- A sudden release of a jam can lead to flash flooding below with the addition of large pieces of ice in the wall of water which will damage or destroy most things in its path

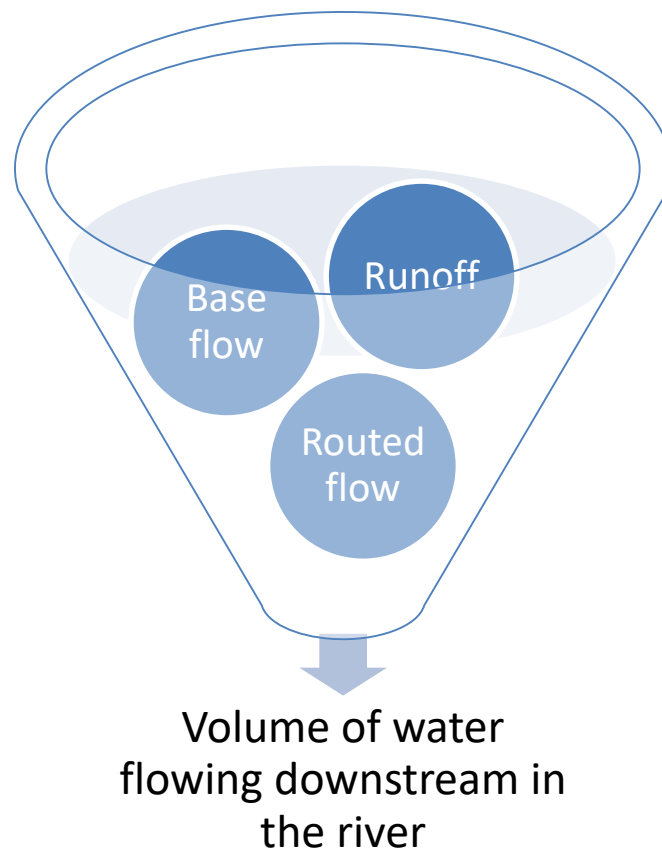

# Hydrology in the National Weather Service

- Why NWS forecasts rivers & what causes flooding in the Albany NWS forecast area
- **Fundamentals of hydrologic modeling**
- NWS flood forecasts & warnings
- The future of NWS hydrology

# A River Basin is a Funnel

The volume of these 3 things determines how much water passes through that outlet (flows downstream):

- Runoff – water flowing across the ground surface (incl. runoff from rain + snowmelt)
- Base Flow – water from groundwater
- Routed Flow – water from upstream

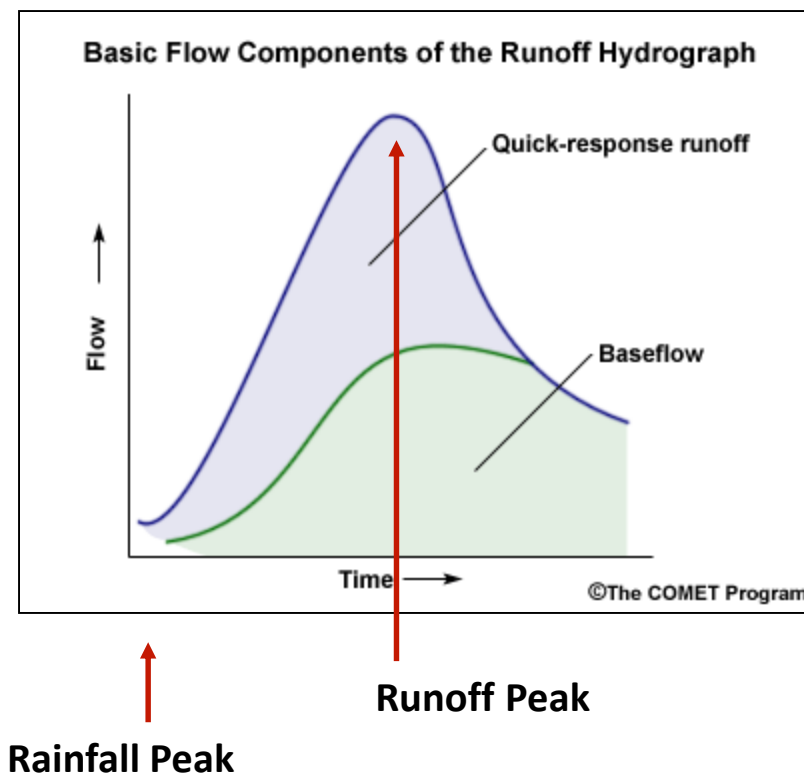

# Runoff

- **Rainfall** runoff is estimated based on:
  - Slope of the land
  - Amount of urbanization
  - Soil types (clay vs. sand)
  - Amount of the last rainfall
  - Time since the last rainfall
  - Amount of evaporation occurring
  - Whether or not the ground is frozen
- **Snowmelt** runoff is estimated based on air temperature

# Runoff + Base Flow

- Delay between onset of rain and runoff entering river
- Amount of delay depends upon where in the basin rain falls, the slope of the basin, and the amount of impervious surface in basin

- Base Flow is water entering the river from groundwater
- Not a constant value
- Peaks after surface runoff begins to decrease
- Slowly decreases until the next rainfall

# Routed Water

- Routed Flow = the water that is coming downstream from the previous (upstream) river basin
- All of the water that passed through the upstream point must eventually pass through the downstream point, barring human intervention (dams/diversion)
- Heavy rains upstream can cause flooding downstream where rainfall was less

# Hydrology in the National Weather Service

- Why NWS forecasts rivers & what causes flooding in the Albany NWS forecast area
- Fundamentals of hydrologic modeling
- **NWS flood forecasts & warnings**
- The future of NWS hydrology

# Inputs to River Forecasts

- Estimated (past) rainfall
  - Automated rain gages w/telemetry
  - Radar rainfall estimates
  - Cooperative weather observer & CoCoRaHS rainfall reports
- Forecast rainfall
- Observed river heights
  - Automated river gages w/telemetry
  - Cooperative weather observer staff gage or wireweight gage readings
- Temperatures / snow pack

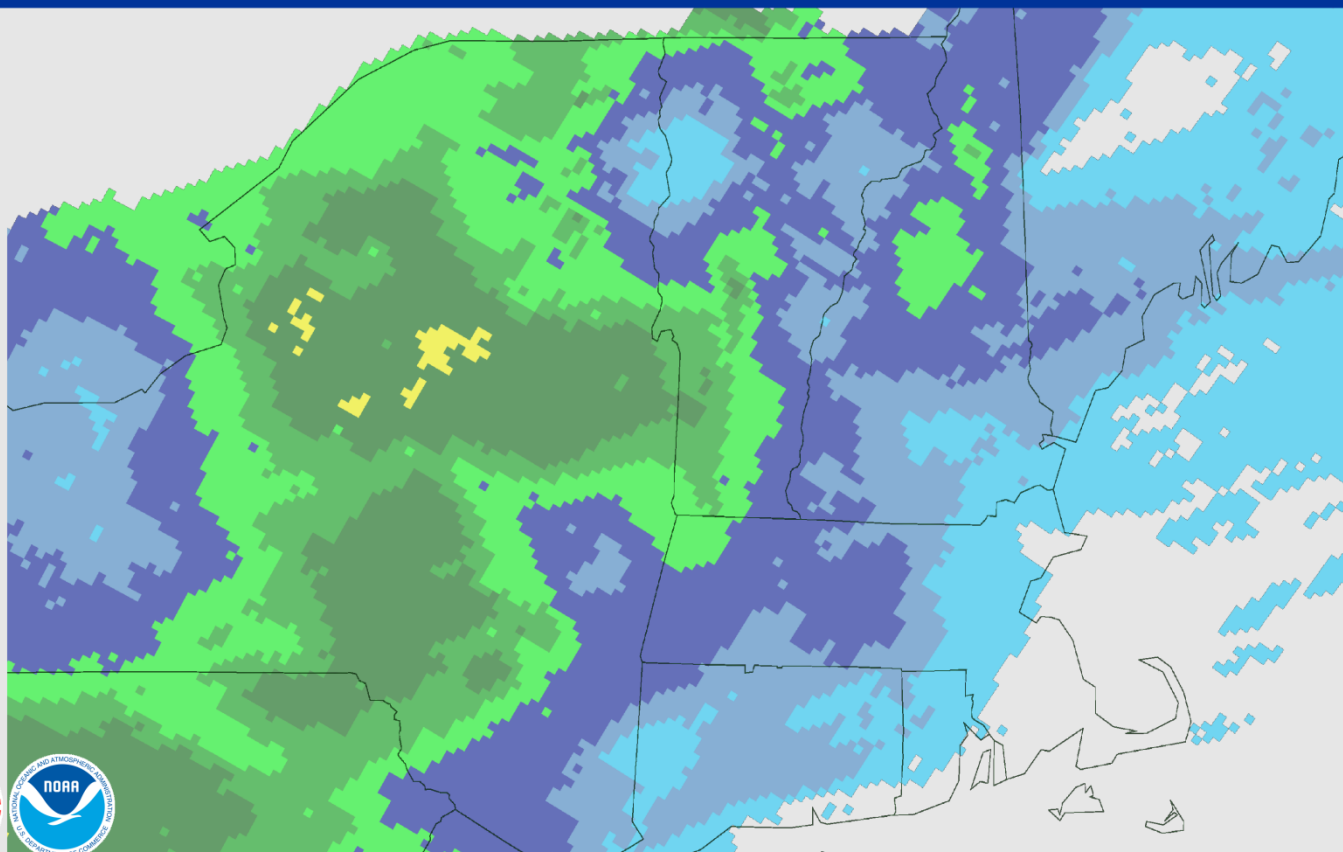

# Estimated (past) Rainfall

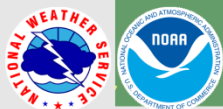

January 24, 2019 1-Day Observed Precipitation

## Snow Melt

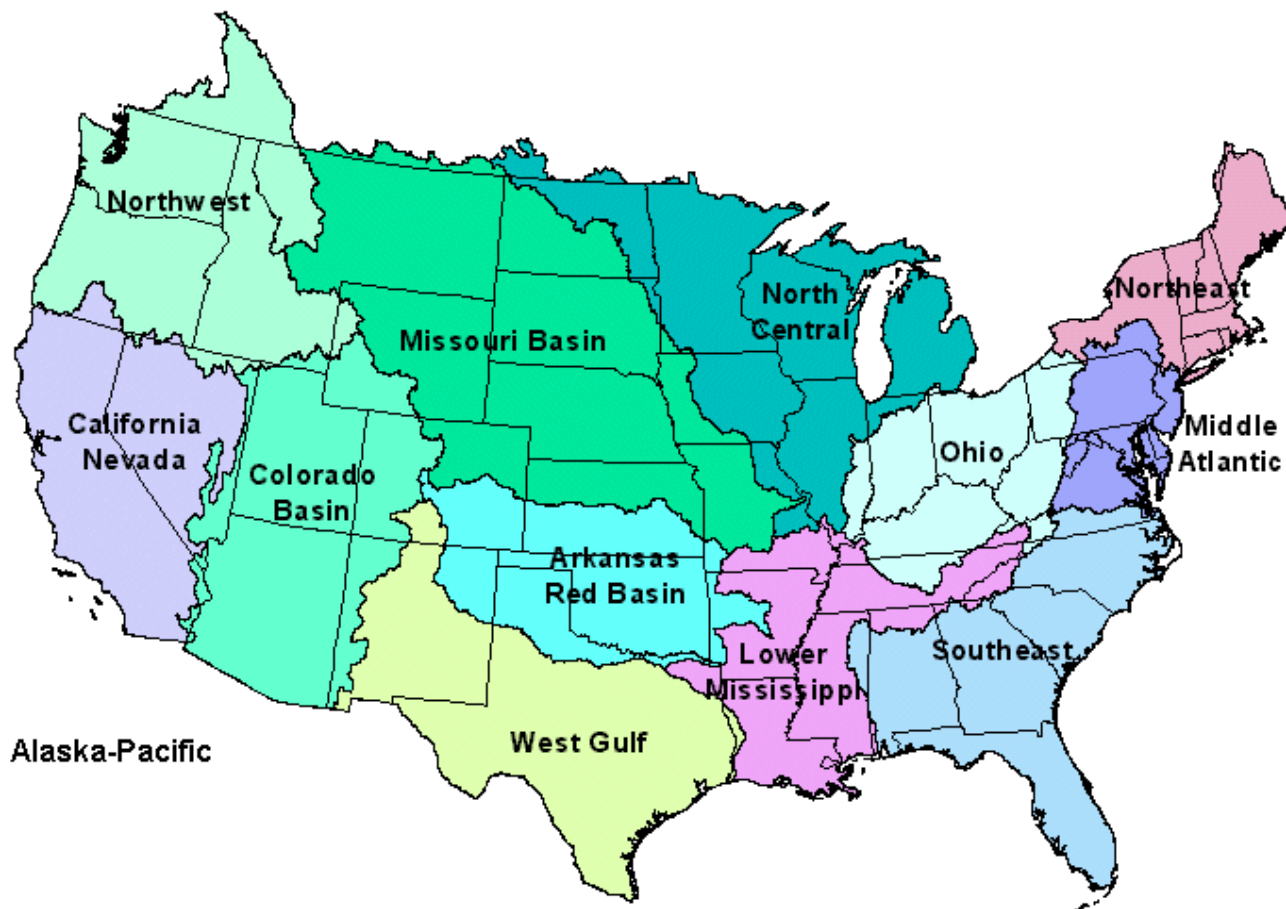

24-Hour Total Ending 2019-04-01 05 UTC

<https://www.nohrsc.noaa.gov/>

# NWS River Forecast Centers

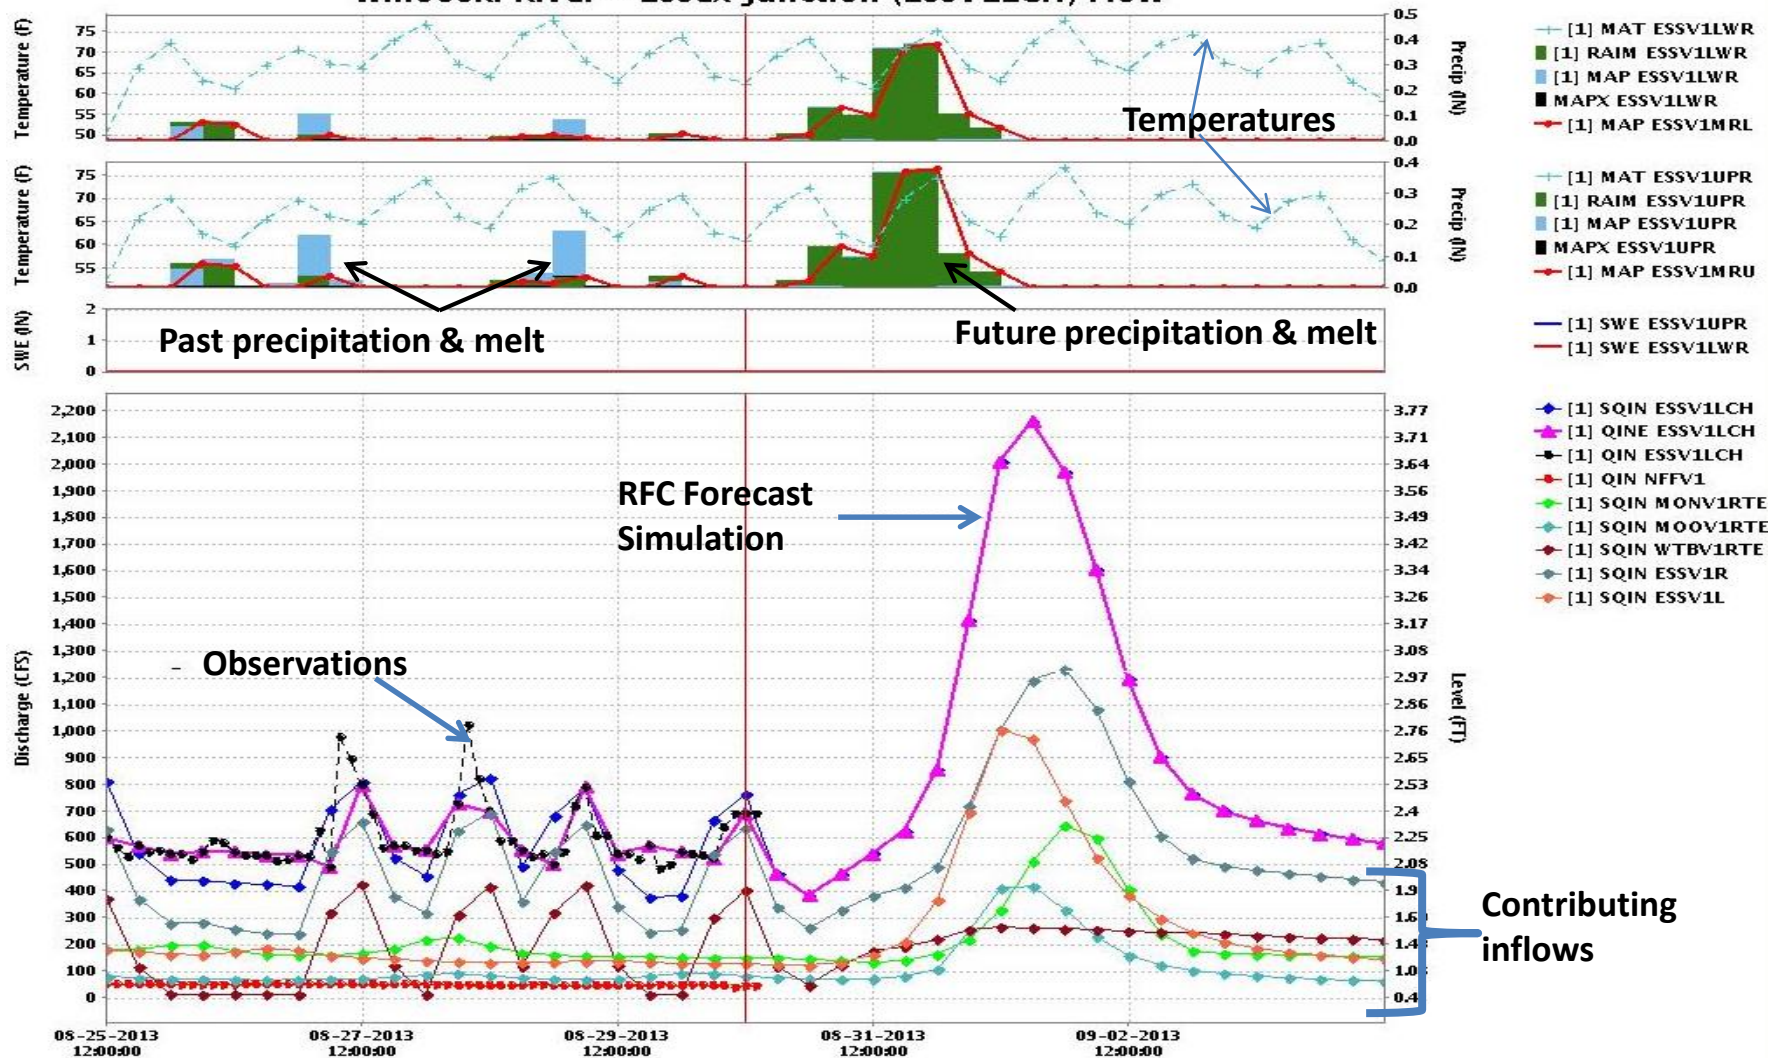

13 River Forecast Centers (RFCs) generate daily river forecasts and additional forecasts during flood events

# River Forecast Center Model

Winooski River - Essex Junction (ESSV1LCH) Flow

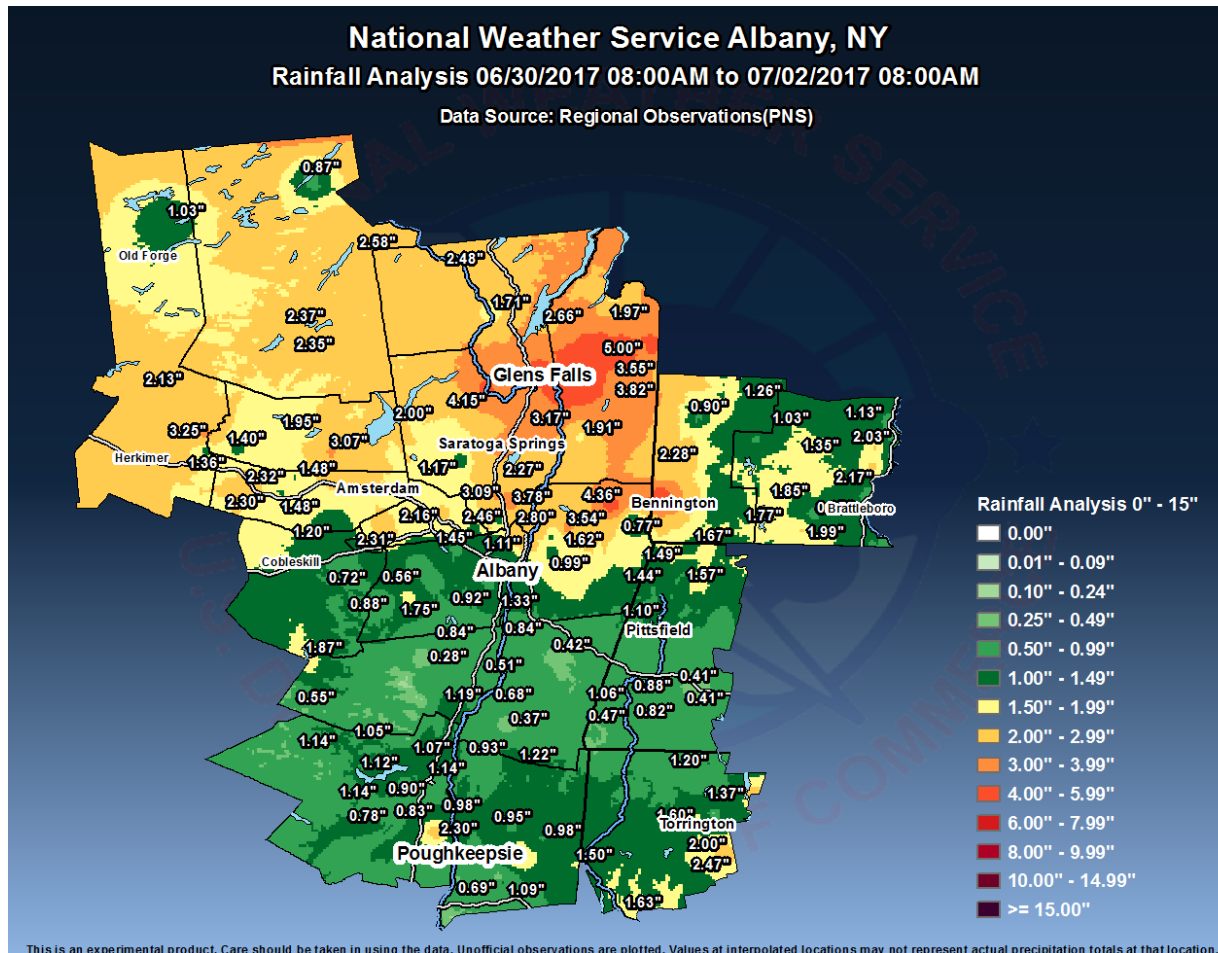

# After RFC issues forecast:

- If the forecast is over flood stage (determined by the local Weather Forecast Office - WFO), a warning is needed:
  - software automatically creates a “first draft”
  - warning can be sent in under 1 minute if needed
  - activates the Emergency Alert System
- Most forecasts are also sent to our website [water.weather.gov/ahps/](http://water.weather.gov/ahps/)

# Hydrology in the National Weather Service

## What we discussed:

- Why NWS forecasts rivers & what causes flooding in the Albany NWS forecast area
- Fundamentals of hydrologic modeling
- NWS flood forecasts & warnings
- The future of NWS hydrology

## Topics we didn't cover:

- Flash flood operations
- Details of hydrologic modeling
- Hydraulic modeling
- Drought operations
- Dam failure operations
- Extreme event operations
- Hydrologic component of IDSS, outreach and education
- Careers in Hydrology
- So many more...

# What questions do you have?

Always happy to discuss more about hydrology as a science and as a career.
