June 2022

Longest Day of the Year in the Northern Hemisphere

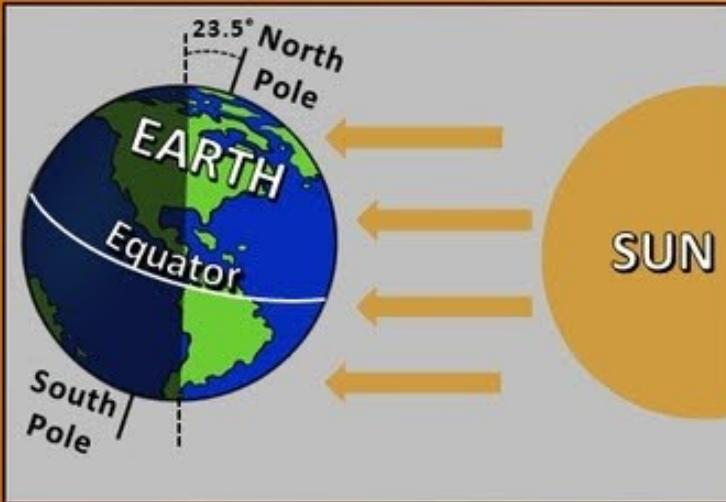

Summer Solstice June 20, 2021 @ 10:32 PM CDT

Weather Forecast Office
Amarillo, TX

Issued June 20, 2021 8:59 PM

- ❖ Today is the longest day of the year in the northern hemisphere due to the tilt of the Earth on its axis with the North Pole leaning most toward the sun (see image below on the left)
- ❖ Solstice means 'sun-stopping' because this is when the sun stops and reverses direction in where it rises and sets
- ❖ The sun is known to set in the west, but as you can see (image below on the right) the sunset tonight was in the north. Starting tomorrow the sun will begin to set closer and closer to due west with the days becoming shorter as the sun slowly begins to rise later and set earlier

August 2022

Why Is Heat More Intense In The Canyon

Canyon floor can be 5° or more hotter than at the Canyon rim

Weather Forecast Office
Amarillo, TX

Issued August 5, 2021 5:11 PM

Why is the heat more intense in the Canyon?

As sunlight hits the ground, it warms the ground, but some light is reflected back into space.

In a canyon, the light being reflected hits the canyon walls again, heating canyon walls. This creates an “oven” effect, heating up the canyon faster than the surrounding areas.

If you visit Palo Duro Canyon starting in July and going through mid August, expect temperatures to be much hotter on the canyon floor.

* 2021 streak has not ended

November of last year was one of 14, out of 130 years, to not have any measurable precipitation for the month. Amarillo easily made it to its top 20 driest periods on record. Amarillo did make it to the number 2 slot by the end of December last year as well.
