I. Introduction

This Annual Operating Plan (AOP) is a procedural guide, based on the National Interagency Agreement for Meteorological Services, which describes fire meteorological services provided within North Dakota. The AOP is updated annually after review by representatives of the National Weather Service (NWS) and each user agency in North Dakota.

II. Service Area and Organizational Directory

Fire meteorological services in North Dakota are provided by the National Oceanic and Atmospheric (NOAA) National Weather Service (NWS) offices in Bismarck and Grand Forks. The NWS weather forecast office (WFO) in Bismarck is responsible for the fire weather program in western and central North Dakota (Fire Weather zone 134). The NWS WFO in Grand Forks is responsible for eastern North Dakota (Fire Weather zone 135). See Figure 1. The normal fire weather season begins in early April and continues to around the end of October. The season will vary according to the actual weather. Fire weather forecasts and other fire weather related information can be found on the Bismarck and Grand Forks Internet web pages:

https://www.weather.gov/bis/ or https://www.weather.gov/fgf/

Figure 1. Fire Weather Zone 134 is shaded, Fire Weather Zone 135 is not shaded.
A. Agency Contact Points:

**Northern Rockies Predictive Services**

5765 West Broadway Street  
Missoula, MT 59808  
406-329-4703  
406-329-4891 (fax)

Steven Ippoliti  
Fire Weather Meteorologist  
954-826-9405  
steven.ippoliti@usda.gov

**National Weather Service Grand Forks:**

4797 Technology Circle  
Grand Forks, ND 58203-0600  
701-795-5127 (Operations)  
701-795-5119 (Coordination)

Melinda Beerends  
Meteorologist in Charge  
melinda.beerends@noaa.gov

Brad Hopkins  
Fire Weather Program Leader  
brad.hopkins@noaa.gov

James Kaiser  
Asst. Fire Weather PL  
james.kaiser@noaa.gov

**North Dakota Interagency Dispatch Center:**

2000 Miriam Circle  
Bismarck, ND 58501  
701-989-7330 (Main dispatch)  
701-989-7299 (fax)  
ndndc@firenet.gov

Mardell Dahlin  
Dispatch Center Manager  
701-989-7331 (Direct Line)

III. Fire Danger Rating for North Dakota

The most commonly accepted definition of Fire Danger is: “The resultant descriptor of the combination of both constant and variable factors which affect the initiation, spread and difficulty of control of wildfires on an area.” The various factors of fuels, weather, topography and risk are combined to assess the daily fire potential on an area. Fire Danger is usually expressed in numeric or adjective terms.

The North Dakota Fire Danger Rating Map is produced each day by the North Dakota Department of Emergency Services around 7:00 AM Central time using information from the Experimental Fire Weather Matrix produced by the National Weather Service (see Section IV.A.3 for details on the Experimental Fire Weather Matrix, and Appendix B.1 for an example). It is a forecast of the potential for non-agricultural grasslands to carry fire. It is based on weather and grassland conditions. The highest threat period for grassland fire danger is usually before the Spring green-up (when grasslands are still in dormancy coming out of the winter season); and again in the late Summer into Fall (when the curing of grasslands lends to critical dryness in the moisture content of the various warm-season and cool-season grasses).

The five fire danger ratings are:
Low  Moderate  High  Very High  Extreme

These ratings may be useful to local fire management officials for daily planning and preparedness purposes.

The following description of Fire Danger Rating is a description of what may happen should a fire ignite. It does not describe whether or not a fire will ignite.

<table>
<thead>
<tr>
<th>Fire Danger Rating and Color Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low (Green)</td>
<td>Fuels do not ignite readily from small firebrands although a more intense heat source, such as lightning, may start fires in duff or punky wood. Fires in open cured grasslands may burn freely a few hours after rain, but woods fires spread slowly by creeping or smoldering, and burn in irregular fingers. There is little danger of spotting.</td>
</tr>
<tr>
<td>Moderate (Blue)</td>
<td>Fires can start from most accidental causes, but with the exception of lightning fires in some areas, the number of starts is generally low. Fires in open cured grasslands will burn briskly and spread rapidly on windy days. Timber fires spread slowly to moderately fast. The average fire is of moderate intensity, although heavy concentrations of fuel, especially draped fuel, may burn hot. Short-distance spotting may occur, but is not persistent. Fires are not likely to become serious and control is relatively easy.</td>
</tr>
<tr>
<td>High (Yellow)</td>
<td>All fine dead fuels ignite readily and fires start easily from most causes. Unattended brush and campfires are likely to escape. Fires spread rapidly and short-distance spotting is common. High-intensity burning may develop on slopes or in concentrations of fine fuels. Fires may become serious and their control difficult unless they are attacked successfully while small.</td>
</tr>
<tr>
<td>Very High (Orange)</td>
<td>Fires start easily from all causes and, immediately after ignition, spread rapidly and increase quickly in intensity. Spot fires are a constant danger. Fires burning in light fuels may quickly develop high intensity characteristics such as long-distance spotting and fire whirlwinds when they burn into heavier fuels.</td>
</tr>
</tbody>
</table>
Extreme (Red) Fires start quickly, spread furiously, and burn intensely. All fires are potentially serious. Development into high intensity burning will usually be faster and occur from smaller fires than in the very high fire danger class. Direct attack is rarely possible and may be dangerous except immediately after ignition. Fires that develop headway in heavy slash or in conifer stands may be unmanageable while the extreme burning condition lasts. Under these conditions the only effective and safe control action is on the flanks until the weather changes or the fuel supply lessens.

Figure 2. North Dakota Fire Weather Zones used for Fire Danger Rating, Fire Weather Watches and Red Flag Warnings.
IV. Services Provided by the NOAA National Weather Service

A. Basic Services

1. Fire Weather Planning Forecast (routine issuance)

This forecast product is issued twice daily during the fire weather season. The planning forecast will be issued at approximately 4 a.m. and 4 p.m. Central Time. For the Grand Forks NWS Office, the morning issuance will be updated to include the observed Haines index.

The morning forecast contains a brief weather discussion, forecasts for today, tonight and tomorrow, and a general 3 to 7-day forecast. The afternoon forecast covers the periods of tonight, tomorrow, tomorrow night, the following day, and a general 3 to 7-day forecast. The product will be updated as needed. The “Discussion” should be tailored to address items of importance to the fire weather forecast. Persistent errors or biases in the forecast should be brought to the attention of the National Weather Service. The local optional elements may vary from office to office.

The Bismarck planning forecast optional local elements will be the mid-level Haines index (Appendix D), LAL (Appendix E), Chance of Wetting Rain (CWR > .10 inches), transport wind, mixing height and smoke dispersal (Appendix F). See Appendix A.2 for examples of these products.

The Grand Forks optional local elements will be the mid-level Haines index, LAL, Precipitation amount, hours of sunshine, transport wind, mixing height, and smoke dispersal.

The National Fire Danger Rating System (NFDRS) is designed to represent the fire potential at peak burning conditions over a large area, generally in excess of 100,000 acres. The NWS offices in Bismarck and Grand Forks provide a point forecast, or Fire Weather Matrix (FWM) for RAWS stations utilized in the forecast NFDRS program. The point forecast is used in the Weather Information Management System (WIMS) forecast NFDRS calculations.

The following RAWS sites will receive point forecasts daily during the fire season:

<table>

<td>324605</td>
</tr>
</tbody>
</table>

The point forecasts (FWM) should be sent by 1545 LDT. Forecasted NFDRS indices are valid 24 hours from the current day’s 1400 LDT observation. The forecasts should be available in WIMS by 1615 LDT.
The Following is an explanation of codes used in NFDRS Forecasts. See Appendix A.3 for an example.

**FCST,STATION#,YYMMDD,13,WX,TEMP,RH,LAL1,LAL2,WDIR,WSPD,,TX,TN,RHx,RHn,PD1,PD2,WETF**

- **FCST**: Indicates individual site forecasts.
- **STATION#:** NFDRS site number
- **YYMMDD**: Date
- **13**: Valid Forecast Time (Always 13 to indicate 1300 LST)
- **WX**: Weather valid at 1300 LST tomorrow. Valid entries are:
  - 0 clear
  - 1 scattered clouds (1/8 to 4/8)
  - 2 broken clouds (5/8 to 7/8)
  - 3 overcast clouds (more than 7/8)
  - 4 foggy
  - 5 drizzle
  - 6 raining
  - 7 snowing or sleet
  - 8 showers (in sight or at the station)
  - 9 thunderstorm
  (Categories 5, 6, 7 sets most NFDRS indices to 0. ERC is the exception)
- **TEMP**: Temperature in degrees F valid at 1300 LST
- **RH**: Relative humidity in percent valid at 1300 LST
- **LAL1**: Lightning Activity Level 1400 LST to 2300 LST
- **LAL2**: Lightning Activity Level 2300 LST to 2300 LST
- **WDIR**: Wind direction valid at 1300 LST
- **WSPD**: Wind speed in mph valid at 1300 LST
- **TX**: Maximum temperature from 1300 LST to 1300 LST tomorrow
- **TN**: Minimum temperature from 1300 LST to 1300 LST tomorrow
- **RHx**: Maximum relative humidity from 1300 LST to 1300 LST tomorrow
- **RHn**: Minimum relative humidity from 1300 LST to 1300 LST tomorrow
- **PD1**: Precipitation duration in hours 1300 LST to 0500 LST
- **PD2**: Precipitation duration in hours 0500 LST to 1300 LST
- **WETF**: Y or N: Wet flag, yes or no. This indicates whether or not fuels will be wet at 1300 LST.
3. Experimental Fire Weather Matrix (routine issuance)

This forecast product is produced twice daily and issued around 4 a.m. and 4 p.m. Central Time. It is available online and through NWS dissemination sources with the product identifier BISOPUBIS. The Experimental Fire Weather matrix provides a county-based value that describes the potential for wildfires to ignite, spread, and be difficult to control in non-agricultural grasslands based on weather conditions, fuel state, and topography. A single value is provided for each of the 53 counties in North Dakota and is provided on a scale of 1 (lowest potential) to 5 (highest potential). A daily forecast for each of the next seven days is provided in the matrix. Weather inputs to the matrix are provided from both the NWS Bismarck and NWS Grand Forks offices, while fuel state information is provided by a calculated Growing Season Index that is supplemented by NFDRS-provided Energy Release Component values. The weather forecast and fuel state information is combined in a model that provides a scale-based value of the potential for non-agricultural grasslands to carry fire based on combinations of critical weather and fuel states, including computation of NFDRS-based Ignition Components and Burning Index values.

See Appendix B.1 for an example of the Experimental Fire Weather Matrix.

4. Fire Weather Watch/Red Flag Warning (non-routine issuance)

These products are essential to the safety of the fire crews. Because of this, a Red Flag Warning should be issued even if the event appears to be borderline. Coordination with surrounding offices and land management agencies is essential. Red flag warnings should be issued any time of the day if conditions warrant.

1) A Fire Weather Watch will be issued when the potential for Red Flag conditions are expected in the next 12 to 72 hours.

2) A Red Flag Warning will be issued if the Red Flag criteria, given below, are expected to be met within the next 24 hours, are imminent or are occurring.

The Red Flag information will be included as a “headline” in the daily planning forecast. It will also be disseminated as a special product that is available on the Internet and NOAA Weather Wire. In addition, the North Dakota Interagency Dispatch Center will be notified by phone at the main dispatch line: 701-989-7330. The main dispatch line is forwarded to the “Dispatcher on Call” on weekends and after hours. If there is no answer, call Marti Dahlin, Center Manager, at 701-848-6649. If this is during the overnight hours, delay notification until 8:00 AM CST/CDT.

See Appendix B for Red Flag Criteria. An example of the fire weather watch and red flag warning product is provided in Appendix A.4.

5. Spot Forecasts (non-routine issuance)

a. Policy
   -Spot Forecasts will be issued upon request of any federal, state, tribal, or local official in support of a wildfire.
   -Upon request of any federal official as required under the Interagency Agreement
   -Upon request of any state, tribal, or local official in coordination with any federal land management agency.
   -Upon request of any public safety official when essential to public safety
   -Will not provide to private citizens or commercial entities not acting as an agent of a government agency.
b. Procedure for Requesting Spot Forecasts

The preferred method to request a spot forecast is via the national spot web page at http://www.weather.gov/spot. The Spot Forecast will be posted to the web page. Our goal is to provide a forecast within 30 minutes of the request; however, higher priority duties may occasionally delay the spot forecast. An updated Spot Forecast may be requested if it appears conditions are significantly different than those forecast. User feedback on the Spot Forecasts is strongly encouraged.

Should the national spot web page be unavailable, requests for Spot forecasts to WFO Bismarck (Fire Zone 134) can also be made using WS Form D-1 or equivalent (Figure 5b). Normally, requests/forms should be submitted by fax (701-250-4450). Topographic information and observed weather conditions should be provided when appropriate/available. Phone inquiries should be directed to 701-250-4494. For Spot Forecast service in eastern North Dakota (Fire Zone 135), call WFO Grand Forks at 701-795-5127. The requesting agency should provide the appropriate fax number or email address for this spot forecast.

The NWS will strive to provide as much detail as possible in the wind forecast. This includes specific wind shift times, wind gusts, etc.

c. Weather Elements Included in Spot Forecasts

Discussion - A brief synopsis of weather features affecting the area

Sky/Weather, Maximum/Minimum temperature, Maximum/Minimum relative humidity, and 20 foot Winds (including shifts and gusts)

Optional Elements (Bismarck) – Mid-level Haines index, transport wind, mixing depth, LAL, and Chance of wetting rain (> .10 inches).

Optional Elements (Grand Forks) - Mid-level Haines index, LAL, Precipitation amount, hours of sunshine, transport wind, mixing height, and smoke dispersal.

See Appendix A.5 for an example of a Spot Forecast.

B. Special Services

1. Incident Meteorologist (IMET) Service

If a wildfire is, or is expected to be, uncontrollable, and loss of life and/or considerable property damage is a possibility, the land management agency may request an on-site deployment of a trained and certified NWS Incident Meteorologist (IMET). An IMET may be requested to a wildland fire at the request of a land management agency through the North Dakota Interagency Dispatch Center. Per NWSI 10-402, “All requests for IMET support will be requested through the NFWOC (National Fire Weather Operations Coordinator).” If a request to the Bismarck Weather Forecast Office for an IMET is made from anyone other than the NFWOC, then contact the Bismarck MIC (Meteorologist in Charge). The MIC will contact the NFWOC on duty, who will facilitate finding an IMET at the regional or national level. The NFWOC 24 hour Duty Number is 877-323-IMET (4638).
V. Wildland Fire Agency Services and Responsibilities

A. RAWS Station Identification Numbers: Procedures for a New RAWS Station

The following steps are necessary in order to correctly provide a new RAWS station with its identification number:

The land management agency responsible for the new site will provide preliminary information on the plans for a new station. This information will be provided to the NWS Central Region Fire Weather Program Manager (Christopher Foltz, available at Christopher.foltz@noaa.gov, 816-268-3143). The preliminary information should also be shared with the local NWS office. The NWS will provide input on siting criteria of the site if requested by the land management agency.

A formal request for the six-digit RAWS identification number will be provided to the responsible NWS office, or directly to the Central Region Headquarters Operational Service Meteorologist.

The regional Operational Services Meteorologist will coordinate with the local NWS office, appropriate land management personnel, and the WIMS staff in order to determine the proper RAWS identification number. Note that the first two digits of the identification number denote the state (in ND, the number is 32), the second pair of digits denotes the county, and the last pair of digits denotes the particular station in that county. In each county, once a station is given a number, that identification number can no longer be used, even if that station becomes inactive.

The regional Operational Services Meteorologist will provide the RAWS identification number to the requesting land management agency and the appropriate NWS office.

The land management agency will notify WIMS in order to assure that the observations are received and sent from the system.

4. Fire Weather Watches and Red Flag Warnings

URGENT - FIRE WEATHER MESSAGE
National Weather Service Bismarck ND
401 AM CDT Fri May 4 2020

...RED FLAG WARNING IN EFFECT THIS AFTERNOON AND EARLY EVENING FOR CENTRAL NORTH DAKOTA...

.Critical fire weather conditions are expected across central North Dakota this afternoon and early evening. Westerly winds will increase to around 25 mph, gusting to 40 mph, with relative humidity values falling as low as 17 percent. Any fires that ignite will spread rapidly in dry fuels and become difficult to control or suppress.

NDZ002>005-010>013-019>023-025-034>037-042-045>048-050-051-042115-0/NEW.KBIS.FW.W.0003.180504T1800Z-180505T0000Z/
Burke-Renville-Bottineau-Rolette-Mountrail-Ward-McHenry-Pierce-Mercer-Oliver-McLean-Sheridan-Wells-Foster-Morton-Burleigh-Kidder-Stutsman-Grant-Sioux-Emmons-Logan-La Moure-McIntosh-Dickey-
401 AM CDT Fri May 4 2018 /301 AM MDT Fri May 4 2018/

...RED FLAG WARNING IN EFFECT FROM 1 PM CDT /NOON MDT/ THIS AFTERNOON TO 7 PM CDT /6 PM MDT/ THIS EVENING FOR WIND AND LOW RELATIVE HUMIDITY FOR CENTRAL NORTH DAKOTA...

The National Weather Service in Bismarck has issued a Red Flag Warning for wind and low relative humidity, which is in effect from 1 PM CDT /noon MDT/ this afternoon to 7 PM CDT /6 PM MDT/ this evening.

* AFFECTED AREA...Central North Dakota.
* WINDS...Northwest 25 mph with gusts to 40 mph.
* RELATIVE HUMIDITY...As low as 17 percent.
* IMPACTS...Any fires that ignite will spread rapidly and become difficult to control or suppress.

PRECAUTIONARY/PREPAREDNESS ACTIONS...

A Red Flag Warning means that critical fire weather conditions are either occurring now....or will shortly. A combination of strong winds...low relative humidity...and warm temperatures can contribute to extreme fire behavior.

5. Spot Forecasts

Spot Forecast for (Name of Incident or Site)...(Requesting Agency)
National Weather Service Bismarck ND
401 AM CDT Fri May 4 2020

Forecast is based on ignition time of 1200 CDT on May (date).
If conditions become unrepresentative...contact the National Weather Service.

.DISCUSSION...High pressure will dominate today resulting in a clear sky and warm temperatures as highs reach near 90F. At ignition time, expect a west northwest wind between 10 and 15 mph, which will become northwesterly by mid afternoon, and gradually decrease in speed to between 6 and 10 mph. A minimum relative humidity of 23 percent is forecast late this afternoon.

An area of showers and thunderstorms is expected to shift across the prescribed burn area after midnight tonight through mid morning Sunday. Gusty and erratic winds can be anticipated with any thunderstorm activity tonight through Sunday.

.REST OF TODAY....

Sky/weather.........Sunny.
Chance of pcpn.......0 percent.
Max temperature......Around 89.
Min humidity........23 percent.
Wind (20 ft).........Northwest winds 5 to 7 mph.
Mixing height.......5700-6800 ft AGL increasing to 7800-9000 ft AGL early in the afternoon.
Transport winds.....West 12 to 17 mph.
Smoke dispersal......Excellent (85400 knot-ft).
Haines Index........5 to 6 OR (moderate) to (high).

.TONIGHT...

Sky/weather.........Partly cloudy then becoming mostly cloudy.
Chance of showers and thunderstorms after midnight.
Chance of pcpn.....30 percent.
Min temperature.....Around 59.
Max humidity.......83 percent.
Wind (20 ft).......Northwest winds to 6 mph early in the evening becoming southeast late in the evening. Gusty and erratic winds expected near thunderstorms after midnight.
Mixing height.......8400-8800 ft AGL decreasing to 500-2200 ft AGL.
Transport winds....West 6 to 9 mph shifting to the southeast 5 to 13 mph in the late evening. Winds becoming south to 15 mph early Sunday morning.

Smoke dispersal....Fair to excellent (27900-70500 knot-ft) decreasing to poor (4300 knot-ft) in the late evening and overnight.

Forecaster...(NWS Forecaster Name)
Requested by...(Requesting Agent Name)
Type of request...PRESCRIBED (or WILDFIRE or HAZMAT, etc.)
B. Red Flag Warning Criteria and the Red Flag Matrix –

The following red flag matrix was based on calculations for Rate of Spread of wildfires using “Behave” software given certain wind and relative humidity values on a sunny summer day with a temperature of 80F, and is used as a “first look” when considering the need for a Red Flag Warning. The chart is meant as a guide, and is not absolute.

Some special considerations (discretion clause) to take into account:
NWS will maintain limited flexibility in using and interpreting the Red Flag Matrix. This flexibility allows forecaster discretion, and will allow forecasters to issue a Red Flag Warning, albeit sparingly, for unforeseen or drastic weather events, such as:

1) Dry thunderstorm activity is foreseen during an extremely dry period.
2) Anytime the forecaster foresees a change in weather that would result in a significant increase in fire danger (e.g., very strong winds associated with a cold front even though the fire danger rating is below the high category, extensive lightning, etc.)
3) During the off-season (post freeze of RAWS stations and pre-greenup of the RAWS stations) forecasters will use the discretion while cross-referencing the Red Flag Matrix in Red Flag decision-making.

EXPLANATION OF SYMBOLS:  † Use 24-hour clock to indicate time. Example: 10:15 p.m. = 2215; 10:15 a.m. = 1015
Indicate local standard time or local daylight time

WS FORM D-1

WS FORM D-1, January 2005

INSTRUCTIONS:

I. Incident Personnel:

1. Complete items 1 through 27 where applicable.

<table>
<thead>
<tr>
<th>Place</th>
<th>Elevation</th>
<th>†Ob Time</th>
<th>20 ft. Wind</th>
<th>Eye Level Wind.</th>
<th>Temp.</th>
<th>Moisture</th>
<th>Remarks</th>
</tr>

<td>NW</td>
<td>32</td>
<td>72</td>
<td>Observations from unit RAWS station, 50% cloud cover.</td>
</tr>
</tbody>
</table>

   a. Example of weather conditions on site:
   b. If the incident (HAZMAT, SAR) involves marine, put the wave/swell height and direction in the Remarks section.

2. Transmit in numerical sequence or fax to the appropriate Weather Forecast Office. (A weather forecaster on duty will complete the special forecast as quickly as possible and transmit the forecast and outlook to you by the method requested)

3. Retain completed copy for your records.

4. **Provide feedback to NWS utilizing separate page.** Be sure to include a copy of the spot forecast with any feedback submission including forecaster’s name. Feedback to NWS personnel is imperative to assist with future forecasts. Remember, feedback on correct forecasts is equally as valuable as feedback on incorrect forecasts! If spot forecast is significantly different than conditions on site, a second forecast may be required.

II. ALL RELAY POINTS should use this form to insure completeness of date and forecast. A supply of this form should be kept by each dispatcher and all others who may be relaying requests for forecasts or relaying completed forecasts to field units.

III. Forms are available from your local National Weather Service Weather Forecast Office. They may also be reproduced by other agencies as needed, entering the phone number and radio identification if desired.

**NOTICE:** Information provided on this form may be used by the National Weather Service for official purposes in any way, including public release and publication in NWS products. False statements on this form may be subject to prosecution under the False Statement Accountability Act of 1996 (18 U.S.C. § 1001) or other statutes.
D. Haines Index Calculations

Computing the Haines Index in Middle Terrain Elevations:

Stability Term = Temp(850mb) - Temp(700mb)
Moisture Term = Temp(850mb) - Dew Point Temp(850mb)

Each term is given a value of either 1, 2 or 3.

Stability Term Value:
1 – if 5 deg C or less
2 – if 6-10 deg C
3 – if 11 deg C or more

Moisture Term Value:
1 – if 5 deg C or less
2 – if 6-12 deg C
3 – if 13 deg C or more

The Stability and Moisture terms are added to calculate the Haines index.

<table>

</tbody>
</table>
F. Smoke Dispersal and Ventilation Terms

**Smoke Dispersal Terms**

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Very Poor</td>
<td>High smoke pollution potential. Usually occurs in a very stable air (strong inversion) and light winds. Normally occurs late at night and early in the morning hours, but could occur during the daytime when a shallow pool of cold air intrudes into the area creating strong low level inversions. Burning is not advised under this category.</td>
</tr>
<tr>
<td>Poor</td>
<td>Moderate to High smoke potential. Burning not advised under this category. Most likely time of occurrence is from evening through the early morning.</td>
</tr>
<tr>
<td>Fair</td>
<td>Marginal smoke pollution potential. Dependent on trend of weather and local conditions. Generally acceptable for small burns of dry fuels.</td>
</tr>
<tr>
<td>Good</td>
<td>Moderate to Low smoke pollution potential. No inversion and gentle winds expected. Most likely to occur in the late morning and afternoon when surface heating usually breaks through the low level inversions.</td>
</tr>
<tr>
<td>Very Good</td>
<td>Low smoke pollution potential. Transport winds or mixing height lower than that for Excellent. Transport winds stronger than that for Good. Most likely to occur in the late morning and afternoon.</td>
</tr>
<tr>
<td>Excellent</td>
<td>Low smoke pollution potential. Unstable airmass and/or brisk winds. Best time to conduct burning operations if fire can be controlled. Most likely to occur in the late morning and afternoon or when a strong weather system affects the area, eliminating all low level inversions and generating moderate winds.</td>
</tr>
</tbody>
</table>

**Breakdown of Ventilation**

**Based on Mixing Height and Transport Wind**

- Excellent.............150,000 Knot Feet and Greater
- Very Good..............100,000 to 150,000 Knot Feet
- Good......................60,000 to 100,000 Knot Feet
- Fair.......................40,000 to 60,000 Knot Feet
- Poor......................Less than 40,000 Knot Feet
G. Listing of RAWS Stations in North Dakota

The following is a listing of active RAWS stations in North Dakota as of March 1st, 2021.
