The severe thunderstorm winds were accompanied with large hail.

During the early to mid afternoon hours of Saturday, June 26th, Severe Thunderstorm Watch numbers 416 and 417 were issued for west and central North Dakota, in anticipation of increasing thunderstorm activity behind, along, and ahead of a surface cold front pushing east across the state. A short wave trough moving east across the Northern Plains provided the necessary trigger mechanism, with ample atmospheric instability and supportive wind shear already present.

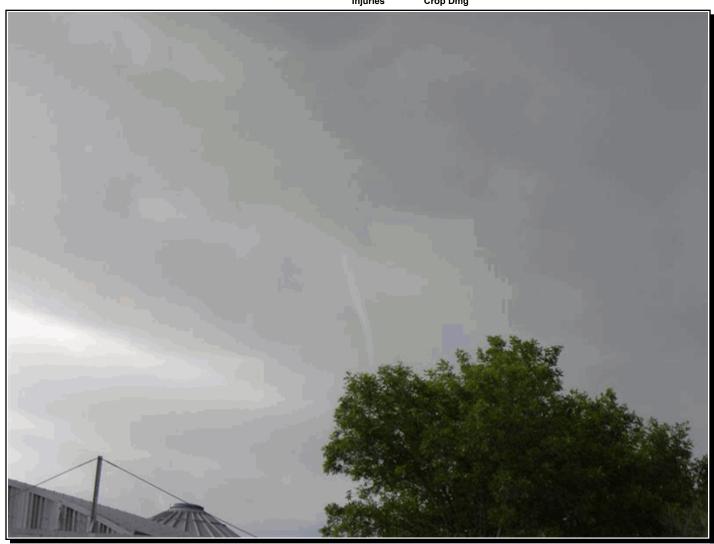

Several severe weather warnings were issued. Several reports of large hail, one funnel cloud report, and two reports of severe thunderstorm winds were received.

Trees and power lines were reported down from the intense thunderstorm winds. In addition, a roof was partially torn off of the Buckskin Bar and Grill and an exterior sign was blown off of another building in Killdeer. Damage was also sustained to other buildings, along with two lightning related fires.

During the early to mid evening hours of Wednesday, June 30th, Severe Thunderstorm Watch number 434 was issued for southwest and west central North Dakota. Strong to severe storms over southeast Montana were expected to advect into North Dakota. These thunderstorms were associated with a weak mid level wave lifting northeast into the Northern Plains. The watch was later expanding to include north central North Dakota as a nocturnal low level jet developed and intensified across the Dakotas, helping to sustain severe convection into the early morning hours of Thursday, July 1st.

Multiple severe thunderstorm warnings were issued. Numerous reports of severe thunderstorm wind gusts were received Wednesday evening.

Please see the storm data entry for July 1st for additional reports related to this episode.
