NWS Meteorologists surveyed damage in western Shelby County and found damage consistent with an EF0 tornado, with maximum sustained winds near 70 mph. The tornado touched down along a gravel road off of County Road 10. The tornado was short-lived and produced a very brief path of uprooted and snapped trees. An on-duty mine guard sitting immediately adjacent to the damage path witnessed a sudden increase in winds, near-zero visibility, and popping of his ears.

Unstable and tropical air interacted with the remains of the circulation of former Tropical Storm Cindy to produce numerous showers and thunderstorms from late morning into the early afternoon hours. A few of these thunderstorms produced wind damage. Locally heavy rainfall of 1 to 3 inches in few spots produced brief excessive runoff and flash flooding.

Flash flooding resulted in the closure of Bassetts Creek Road.

Tropical Storm Cindy first developed in the central Gulf of Mexico on the afternoon of Tuesday, June 20th and made landfall between Cameron, LA and Port Arthur, TX during the early morning hours of Thursday, June 22nd. Despite the center of the storm being far removed from the north central Gulf Coast, the effects of Cindy extended several hundred miles to the east of the center and impacted the local area starting late Tuesday and persisting through the end of the week.

The primary impact across southwest and south central Alabama was from heavy rain and flooding. The highest storm total observed was in Thomasville, AL which measured 11.37" of rain ending Friday night, June 23rd. Numerous locations across south central and southwest Alabama recorded 5 to 10 inches of rain. The heavy rain resulted in numerous instances of flash flooding and minor to moderate river flooding.

Coastal flooding also impacted Mobile and Baldwin Counties, particularly in the typical low lying locations. Tidal gauges indicate the maximum inundation was around 3 feet MHHW in the north end of Mobile Bay.

Four tornadoes occurred in southern Alabama during Cindy, 3 EF-0 and 1 EF-1.

Two fatalities occurred, one due to high surf and one due to rip currents.
