	07/25/20 17:00 CST		0	Thunderstorm Wind (EG 50 kt)
	07/25/20 17:00 CST		0	Source: Public

Several trees uprooted in the town of Maplesville.

A typical summertime afternoon regime was present over Central Alabama with steep low level lapse rates and high surface based CAPE values. A tropical system was located over the northwestern Gulf of Mexico and this produced an enhanced sea-breeze boundary that pushed northward into the southern portions of Central Alabama. The sea-breeze boundary collided with a line of storms moving westward from Georgia and produced isolated strong to severe storms.

Location Date/Time Deaths & Property & Event Type and Details Injuries Crop Dmg

An isolated thunderstorm developed over Decatur and also over the adjacent waters of Lake Wheeler (Tennessee River system) between 1740-1800 LST. A well photographed and reported waterspout developed around 1753 LST and lasted several minutes. The waterspout appeared as a narrow elephant trunk tube in numerous photos and videos sent into social media or directly to the National Weather Service in Huntsville. From the videos and photos received, the waterspout became a landspout tornado at times on the eastern shore of Lake Wheeler, just a few hundred yards south of the U.S. Highway 31 causeway. Due to reporting requirements, this will be logged as a tornado with an Unknown EF rating since no damage was reported. On the opposite side of Lake Wheeler, near the Bank Street district of Decatur, a small downburst knocked down portions of a large tree onto power lines. Photos of the storm from a distance also indicated a "rain foot" typically noted by storm spotters which correlated very near the location of the damage.

High winds downed multiple trees near River Falls.

A cluster of thunderstorms developed in a northwest upper level flow pattern and moved southward across the area. These storms caused damaging winds in excess of 60 mph, large hail and very heavy rain as they moved across the area.
