	02/19/25 04:00 CST		0	Winter Weather

An upper-level shortwave moved through the region February 18 into February 19, creating large-scale lift that brought precipitation to parts of Central Alabama. As a surface front moved through, temperatures across northern counties fell below freezing by early on February 19, and sleet and snow was observed in some counties. The counties of Marion, Walker, and Blount saw accumulations of generally around a half inch, with up to one inch in Winston County.

The tornado touched down near the intersection of Lamar Road and Frankfort Road. The tornado caused immediate and widespread damage in neighborhoods southwest of downtown Tuscumbia. This includes roof damage to an elementary school off Glendora Avenue. Damage indicators were mostly a combination of uprooted hard and softwood trees. Numerous homes had roof damage associated with felled trees. As the tornado tracked into downtown, power lines and traffic signals were destroyed. Significant roof damage occurred near 5th and Main Streets where a metal roof was completely removed. As the tornado moved out of the downtown area, numerous trees were again uprooted along 5th and 6th Streets through Commons Street. The tornado snapped trees before crossing George Wallace Boulevard and the Southern Railway. Additional trees were snapped or uprooted as the tornado moved northeast approaching Woodward Avenue. At this location, part of a service station canopy was removed. Fences were knocked down on adjacent streets in this area. More softwood trees were snapped or uprooted as the tornado moved through residential areas approaching Muscle Shoals High School. On school property, several trees were snapped, some near the base, but the building itself didn't sustain any damage. There were other sporadic trees randomly snapped south of this location along portions of Washington Drive and Colorado Avenue, but this wind damage was determined to be strong winds in the rear flank downdraft of the occluding tornadic circulation. The Northwest Alabama Regional Airport measured an 84 MPH wind gust as the tornado occluded just northwest of the airfield.

The tornado quickly formed while embedded within the line of severe thunderstorms late Saturday night. It touched down just south of Russellville Road and east of Harris Creek. There the tornado blew out the doors of a large, metal storage shed and lofted an ATV across the property. The tornado shifted east-northeast just south of Russellville Road and Highway 75 where it uprooted numerous hardwood trees, some of which fell on houses. Residents at this location received advanced National Weather Service warning and took refuge in their tornado shelter before their home was impacted. Several homes also experienced partial roof loss further east on Russellville Road. The tornado shifted north of Highway 24 where the vortex contracted and strengthened. Among uprooted hardwood trees on one property, the upper quarter of a large silo collapsed. Further east, numerous trees were uprooted, some on houses and cars. Near the Highway 78 and Highway 83 junction, a manufactured home was impacted with roof and siding damage. The resident was thankful for the early warning from the National Weather Service as it allowed time for her family to safely seek refuge. The tornado tracked east-northeast of Highway 78 and destroyed several small farm buildings before impacting homes near the McGuire Loop area. Near McGuire Loop and Rocky Glen Road, the tornado knocked down numerous power lines in trees before completely removing the roof of one single-family residence. A brick wall collapsed on an male occupant requiring hospitalization. This is where the strongest intensity of the tornado likely occurred. The tornado traveled to the northeast portion of McGuire Loop where pine trees were snapped. The tornado lifted west of Highway 87.

An impactful severe weather event occurred during the late evening of the 15th into the early morning of the 16th. A squall line of severe thunderstorms pushed east across north Alabama, producing widespread wind damage and 8 tornadoes (1 EF-2, 6 EF-1 and 1 EF-0). Numerous trees, power poles and power lines were knocked down, resulting in road blockages and structural damage.

02/19/25 10:00 CST 0

Cold air filtered into northern Alabama behind a cold front during the evening into the overnight hours on Tuesday, February 18th. As precipitation developed along and just north of the front during the evening hours, it fell as light snowfall. This precipitation continued until a few hours after daybreak on Wednesday (February the 19th) as light or moderate snowfall. One to two inches of snowfall accumulation was common across northern Alabama after this activity ended early Wednesday morning. Temperatures continued to be below freezing much of the day, keeping roads icy. 20 car crashes in Madison county occurred through 8 AM on Wednesday due to the slick conditions. Car crashes were also reported in Lauderdale county on the Singing River Bridge.

WASHINGTON COUNTY 4.0 ENE FRANKVILLE [31.67, -88.09], 4.5 ENE FRANKVILL	E [31.68, -88.08]	
02/12/25 18:15 CST	0	Tornado (EF2, L: 0.55 mi , W: 650 yd)
02/12/25 18:18 CST	0	Source: NWS Storm Survey

An EF2 tornado occurred just south of Coffeeville near Tattlersville. This tornado began on the west side of the Tombigbee River based on radar observed tornado debris signature. Prior to highway 69, high resolution satellite imagery revealed a substantial swath of EF1 tree damage with numerous convergent tree uproots in about a 650-yard-wide swath. The tornado first crossed Highway 69 where ground survey crew observed scattered to numerous trees snapped or uprooted. The tornado intensified as it went northeast quickly widening again to near 650 yards wide and beginning to produce EF2 tree damage between Highway 69 and Winn Road. Low end EF2 tree damage was observed by ground survey crew on Winn Road where many tree snaps occurred. The next road the tornado crossed was Center Point Road and Norris Road where multiple tree snaps were observed. The tornado briefly re-attained EF2 intensity with numerous tree snaps and uproots visible on high resolution satellite imagery between Norris Road and Reedy Hill Road. As the tornado approached and crossed Reedy Hill Road it gradually weakened, lifting just northeast of Reedy Hill Road.
