

Drought Information Statement for Northern and Eastern Maine

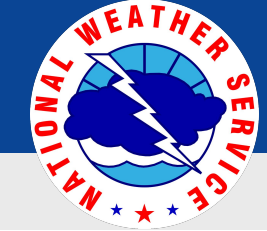

Valid August 27, 2026

Issued By: WFO Caribou, ME

- Next update by Thursday, September 10th unless conditions warrant sooner
- Please see all currently available products at <https://drought.gov/drought-information-statements>.
- Please visit <https://www.weather.gov/car/DroughtInformationStatement> for previous statements.
- Please visit <https://www.drought.gov/drought-status-updates/car> for regional drought status updates.

- Groundwater and streamflows continue to worsen across the region leading to the expansion of Moderate & Severe Drought
- Much of Eastern & Northern Maine is seeing Below to Much Below Normal Groundwater & Streamflow conditions
- Drought persistence expected into the fall

U.S. Drought Monitor

August 27, 2026
12:33 PM EDT

Link to the [latest U.S. Drought Monitor](#) for Maine

- **Drought Intensity and Extent:**

- **D2 (Severe Drought):** Far Southern Penobscot, Far Southwest Hancock counties.
- **D1 (Moderate Drought):** Central & Southern Aroostook, Much of Piscataquis, Much of Penobscot, Eastern & Northern Hancock and Northern & Eastern Washington counties.
- **D0: (Abnormally Dry):** Northern Somerset, Western, Northern & Northeast Aroostook and Southern Washington counties.

Percentage of Maine in Drought

- **No Drought:** 6.61%
- **D0: (Abnormally Dry):** 32.26%
- **D1 (Moderate Drought):** 52.18%
- **D2 (Severe Drought):** 8.95%

U.S. Drought Monitor Maine

August 25, 2026

(Released Thursday, Aug. 27, 2026)

Valid 8 a.m. EDT

Intensity:

The Drought Monitor focuses on broad-scale conditions. Local conditions may vary. For more information on the Drought Monitor, go to <http://droughtmonitor.unl.edu/About.aspx>

Recent Change in Drought Intensity

August 27, 2026
12:33 PM EDT

Link to the latest [1-month change map](#) for Northeast U.S.

- Four week drought monitor class change:
 - **Drought Worsened:** Nearly the entire forecast area.
 - **Drought Improved:** None.
 - **No Change:** Small areas of Washington and Hancock counties.

14 Day Precipitation

August 27, 2026
12:33 PM EDT

Link to [Northeast Regional Climate Center](#)

- Precipitation is much below normal across much of Northern & Eastern Maine with much of the rainfall just isolated to scattered in nature.
- Near to slightly above normal precipitation in very isolated areas of Downeast & Northern Maine.

Precipitation (in)
8/13/2026 – 8/26/2026

Generated 8/27/2026 using provisional data.

Percent of Normal Precipitation (%)
8/13/2026 – 8/26/2026

ACIS Web Services Generated 8/27/2026 using provisional data.

ACIS Web Services

30 Day Precipitation

August 27, 2026
12:33 PM EDT

Link to [Northeast Regional Climate Center](#)

- Precipitation is below normal across much of Northern & Eastern Maine with much of the rainfall just scattered.
- Slightly above normal precipitation in very isolated areas of Downeast & Northern Maine.

Precipitation (in)
7/28/2026 – 8/26/2026

Generated 8/27/2026 using provisional data.

Percent of Normal Precipitation (%)
7/28/2026 – 8/26/2026

ACIS Web Services Generated 8/27/2026 using provisional data.

ACIS Web Services

Precipitation Deficits

August 27, 2026
12:33 PM EDT

- 2026 precipitation deficits compounding the deficits from the 2025 Drought in much of the area.
- Northern Maine is running 90-100% of normal for the 2026 year to date which is allowing for slow worsening of the ongoing dry conditions.

Percent of Normal Precipitation (%)
8/27/2025 – 8/26/2026

Generated 8/27/2026 using provisional data.

Percent of Normal Precipitation (%)
1/1/2026 – 8/26/2026

ACIS Web Services Generated 8/27/2026 using provisional data.

ACIS Web Services

Much of the area is seeing compounding drought impacts.

30 Day Temperatures

August 27, 2026
12:33 PM EDT

Link to [Northeast Regional Climate Center](#)

- 30 Day Temperatures have been running 1-2.5 degrees above normal across much of Eastern/Northern Maine.
- Warm temperatures + lack of rainfall causing increased evaporation and in growing season causing significant demand on the water system.

Temperature (F)
7/28/2026 – 8/26/2026

Generated 8/27/2026 using provisional data.

Departure from Normal Temperature (F)
7/28/2026 – 8/26/2026

ACIS Web Services Generated 8/27/2026 using provisional data.

Hydrologic Conditions and Impacts

August 27, 2026
12:33 PM EDT

USGS State of Maine Dashboard: <https://waterdata.usgs.gov/state/maine/>

- **Northern Basins:**
 - Below to Much Below Normal flows
- **Central Highlands, Moosehead & Baxter Regions:**
 - Below to Much Below Normal flows
- **Downeast to Bangor Basins:**
 - Below to Much Below Normal flows except Normal flows on St. Croix River.
- **Areawide Trends:**
 - Expect flows to continue slowly falling.

Groundwater Impacts

August 27, 2026
12:33 PM EDT

- Near surface soil moisture across much of Maine has continued to struggle and remains very dry. Recent rainfall Downeast has quickly dried out. Shallow soil moisture changes rapidly during the growing season.
- Deeper soil moisture down to near 39" has worsened rapidly through the summer growing season.

SPoRT-LIS 0-10 cm Soil Moisture percentile valid 27 Aug 2026

SPoRT-LIS 0-100 cm Soil Moisture percentile valid 27 Aug 2026

[Soil Moisture Percentile 0-100cm Depth](#)

Groundwater

August 27, 2026
12:33 PM EDT

- The 2025-26 Drought that did improve in the late spring only improved enough to lower drought conditions. Deeper moisture only improved slightly but is being taxed heavily in the 2026 growing season combined with rainfall deficits in July and August 2026. This is leading to the well below normal groundwater conditions.

[USGS Groundwater Gauge Status](#)
[Soil Moisture Percentile 0-200cm Depth](#)

Groundwater Gage Plots

August 27, 2026
12:33 PM EDT

USGS Groundwater Levels in New England: https://newengland.water.usgs.gov/web_app/GWW/GWW.html

Groundwater gage data indicates high water system demand due to the growing season, compounded by a failure to fully recover from the 2025-26 drought. Consequently, multiple locations are currently reporting conditions at or near record lows.

Rainfall Needed to “End the Drought”

August 27, 2026
12:33 PM EDT

Precip Needed to End Drought Conditions in 1 Month Precip Needed to End Drought Conditions in 2 Months

- Steady, light-rain events with high absorption rates are ideal.
- These values have increased significantly due to recent deficits as precipitation remains dependent on showers & thunderstorms.

Summary of Impacts

August 27, 2026

12:33 PM EDT

Links: See/submit [Condition Monitoring Observer Reports \(CMOR\)](#) and view the [Drought Impacts Reporter](#)

Hydrologic Impacts

- Regional streamflows, lake levels, seasonal wetlands, and storage reservoirs are experiencing widespread drops due to a combination of seasonal midsummer drawdown, diminished surface runoff, and heightened water demand.
- Lakes/ponds running below normal exposing rocks posing threats to recreational activities.

Aquifer Deficits

- Groundwater recharge continues to lag across the region, maintaining significant, lingering storage deficits. Multiple monitoring wells across Eastern/Northern Maine are currently reading Below Normal to Much Below Normal compared to historical climatological baselines. Low water tables are compounded by multi-year precipitation deficits and depleted baseline levels carried over from previous dry seasons.

Dry Drinking Water Wells

- A few new dry well reports in August, will monitor as conditions worsen.
- Maine EMA Dry Well Survey: <https://maine-dry-well-survey-maine.hub.arcgis.com/>

Agricultural Impacts

- Reduced soil moisture has forced farmers to expand irrigation. Apple orchards and blueberry fields have reportedly shown visible moisture stress, field corn exhibits stunted growth, and perennial gardens are wilting. Severe dryness is triggering premature leaf drop in some maples and wild apple trees. Pasture growth has stalled in many areas, forcing dairy producers to begin supplemental hay feeding ahead of schedule. Agricultural and rural communities are actively mitigating water shortages by hauling water for livestock, curtailing non-essential outdoor and indoor water use, and managing low or dry domestic and agricultural wells.

Mitigation Actions

- Please refer to your municipality and/or water provider for mitigation information.

Long Range Outlooks (September)

August 27, 2026
12:33 PM EDT

The latest monthly and seasonal outlooks can be found on the [CPC homepage](#)

Main Takeaways for September:

- No significant signal for above/below normal temperatures in the state.
- No significant signal for above/below normal precipitation in the state.

Pattern Outlook

- El Niño is continuing to strengthen but uncertainty remains on the subseasonal pattern influences in September. This is concerning given our ongoing dry conditions.

Right - [Climate Prediction Center 1 Month Precipitation Outlook.](#)

Long Range Outlooks (Sept-Nov)

August 27, 2026
12:33 PM EDT

The latest monthly and seasonal outlooks can be found on the [CPC homepage](#)

Main Takeaways for Sept-Nov:

- Weak signal for above normal temperatures in the state.
- Weak signal for below normal precipitation in the state.

Pattern Outlook

- El Niño is continuing to strengthen but uncertainty remains on the subseasonal pattern influences this fall. This is concerning signals given our ongoing dry conditions.

El Niño / Southern Oscillation (ENSO)

August 27, 2026
12:33 PM EDT

El Niño is strengthening, with a greater than 90% chance of a very strong event during the Northern Hemisphere fall and winter 2026-27. The CPC Official ENSO outlook indicates there is a 69% chance of a historic event that would exceed the strength of previous El Niño events dating back to 1950.

Strong to Very Strong El Niño events historically deliver above-normal winter temperatures and above-normal precipitation across Maine.

- A higher proportion of winter storms often produce rain or sleet/freezing rain rather than long-lasting dry snow, particularly in coastal and southern valley regions.
- Periods of mild temperatures between weather systems often cause existing snowpack to melt repeatedly throughout the season.
- Frequent runoff events would favor robust surface water replenishment (lake, reservoirs, & streamflows)
- Deep ground frost may fail to establish or remain shallow, providing abnormally high mid-winter groundwater recharge

NOAA CPC ENSO Strength Probabilities (issued August 2026)

Net Drought Outlook: Even with expectations of a deficient seasonal snowpack, the net hydrologic impact is often favorable for reducing drought

Main Takeaways

August 27, 2026
12:33 PM EDT

- **Bottom Line:** drought continues to worsen across Eastern and Northern Maine with no significant improvements expected.
 - *Full aquifer recovery is unlikely until Winter 2026 / Spring 2027.*
- Groundwater trends continue to show significant worsening.
- Outlook: Long-term prognosis remains concerning but a strong El Niño Winter is hopeful.
 - Will need to monitor trends for fire danger, drinking water supplies and surface water conditions.
- Repeating light wetting rains will be vital to improve soil moisture, otherwise evaporative losses will dominate.
- Stakeholders should prepare for worsening drought conditions this fall.
- **Note: Groundwater & streamflow levels reach climatological minimums in September.**

<https://experience.arcgis.com/experience/016ac3b48c5049909106a23e6556311b>

- Condition Monitoring Observer Reports on Drought (CMOR-Drought) is a tool provided by the National Drought Mitigation Center (NDMC) in partnership with the National Integrated Drought Information System (NIDIS).
- Submit reports here:
<https://droughtimpacts.unl.edu/Tools/ConditionMonitoringObservations.aspx>
- The tool allows citizen scientists to submit observation reports relating to drought, which are presented in a map that can be used to view and access submitted information and attachments. These reports are vital for determining the drought conditions.
