

GOES-16 Data and Products around the Great Lakes

Scott Lindstrom
University of Wisconsin-Madison
Cooperative Institute for Meteorological Satellite Studies
(CIMSS)

Thank you to Many People

- Tim Schmit, NOAA
- Scott Bachmeier, CIMSS
- Bill Line, NWS PUB
- Dan Lindsey, NOAA
- Jordan Gerth, CIMSS
- Lee Cronic, CIMSS
- Mat Gunshor, CIMSS
- Kathryn Mozer, PRO
- Chad Gravelle, OPG
-

Advertisement!

- FDTD GOES-16 Applications Webinars
 - Forecaster-led discussions on something related to GOES-16.
 - Have you seen something interesting with GOES-16 data? Tell your peers about it!
 - Every other Wednesday, sometime around 18z
 - 15 minutes in length, then 15 minutes (or so, sometimes less) of questions and discussions
 - Contact Dan.bikos@colostate.edu or scott.lindstrom@ssec.wisc.edu!

GOES-R Series Instruments

SUVI

ABI

GLM

Advanced Baseline Imager (ABI)

5^x

Faster coverage
(5-minute full disk
vs. 25-minute)

4^x

Improved spatial
resolution
(2 km IR vs. 4 km)

3^x

More spectral
bands (16 on ABI
vs. 5 on the
current imager)

Plus improved radiometrics and higher bit depths, etc.

26th Great Lakes Operational
Meteorology

GOES-17

- First Light Imagery Press Release is scheduled for May ~~9~~ 14
- Fixed-grid format data flowing to SBN in July (July 9th, right now). (“**Once data are beta-mature**, the GRB is populated and data flows to SBN”)
- Preliminary non-operational data until it moves to station (137 W) in October. Provisional is scheduled for late August.

16 Bands: Do you use them all?

Band Number	Central Wavelength	Nickname	Principal Use
1	0.47 μm	“Blue Visible”	Smoke, Aerosols
2	0.64 μm	“Red Visible”	Everything visible
3	0.86 μm	“Veggie”	Land/Water, Burn scars
4	1.37 μm	“Cirrus”	High Clouds
5	1.61 μm	“Snow/Ice”	Water/Ice discrimination
6	2.24 μm	“Cloud Particle Size”	Cloud Particle Size

How can you make a true color image with GOES-R?

ABI FM1 v2 (Jan2014) Visible SRFs & Various ASTER Reflectance Spectra

Combine the two vis and the veggie band

G-16 IMG . 20 APR 18 (2018110) 18:57 UTC . SHCSV2 . NOAA NESDIS / UW-CIMSS / SSEC

McIDHS

G-16 IMG . 20 APR 18 (2018110) 12:02 UTC . SHCSV2 . NOAA NESDIS / UW-CIMSS / SSEC

McIDAS

16 Bands: Do you use them all?

Band Number	Central Wavelength	Nickname	Principal Use
7	3.9 μm	“Shortwave IR”	Fire, Fog
8	6.19 μm	“Upper-level WV”	Jet streaks, cirrus
9	6.95 μm	“Mid-level WV”	Cyclogenesis
10	7.34 μm	“Low-level WV”	EMLs
11	8.5 μm	“Cloud Phase”	SO ₂
12	9.6 μm	“Ozone”	Ozone
13	10.3 μm	“Clean Window”	Fog, weather
14	11.2 μm	“Window”	Convection
15	12.2 μm	“Dirty Window”	Moisture
16	13.3 μm	“CO ₂ ”	Tropopause Temperature

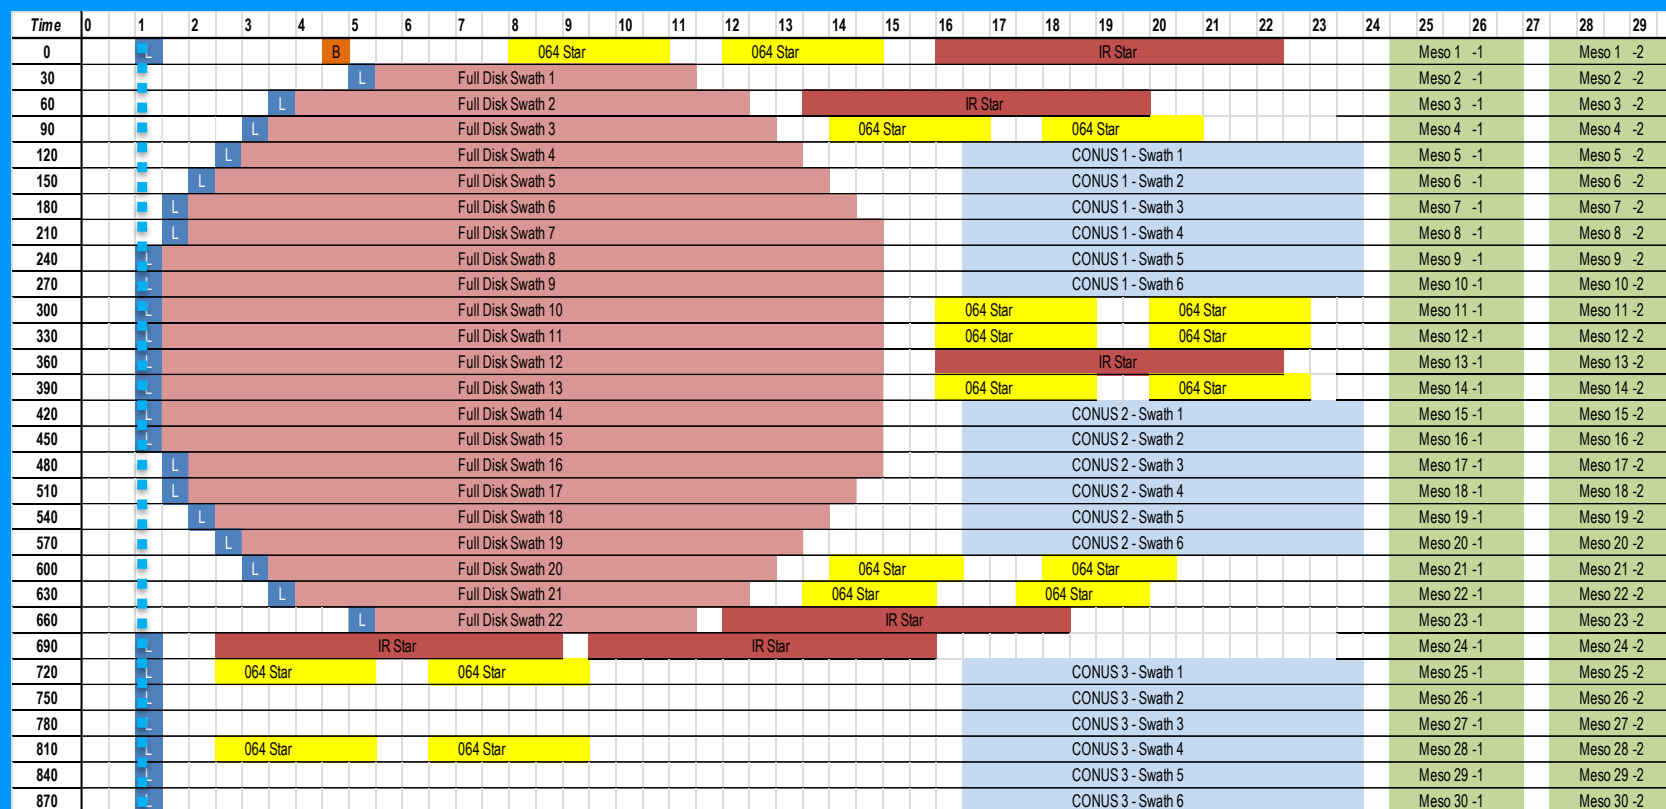

Confession: I don't! But some are used in products!

Why so many Infrared Bands?

ABI Mode 3 (Flex mode)

‘White’ space in the graph is instrument idle time: 4+ minutes out of 15
 Each CONUS scan takes 42 seconds total over the course of 2.5 minutes
 This is likely the default Scanning Mode on ABI

This chart shows a series of 30-second strips over 15 minutes

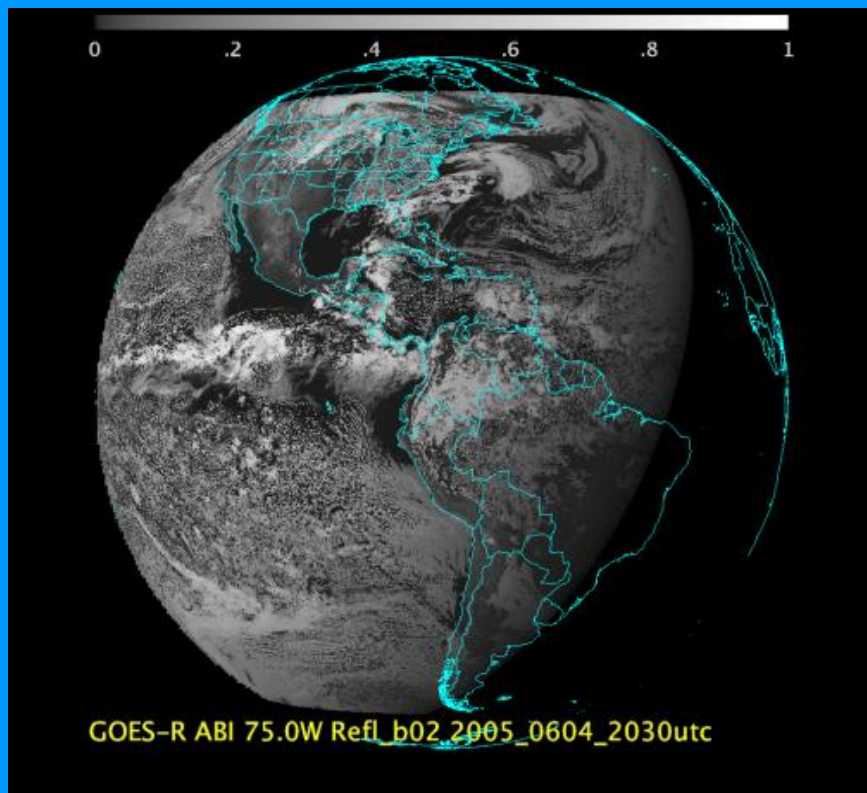

Easier than that chart

- In 15 minutes, you get
 - 1 Full Disk
 - 3 CONUS Images
 - 30 Mesoscale Sector scans
 - Plenty of Idle Time
- Note that the image scanning is all interleaved.
 - A CONUS scan occurs during the northern Hemisphere part of the Full Disk, and during the southern Hemisphere part, and after the FD scan
 - The Mesos are happening all the time too.

Baseline ABI Sectors

Flex Mode/Mode 3:
Full Disk every 15 minutes
Continuous Full Disk/Mode 4:
Full Disk every 5 minutes

Flex Mode/Mode 3:
CONUS every 5 minutes

Flex Mode/Mode 3:
2 Meso sectors every minute
(This example is over Puerto Rico)

CONUS Domains

Simulated Data

Simulated Data

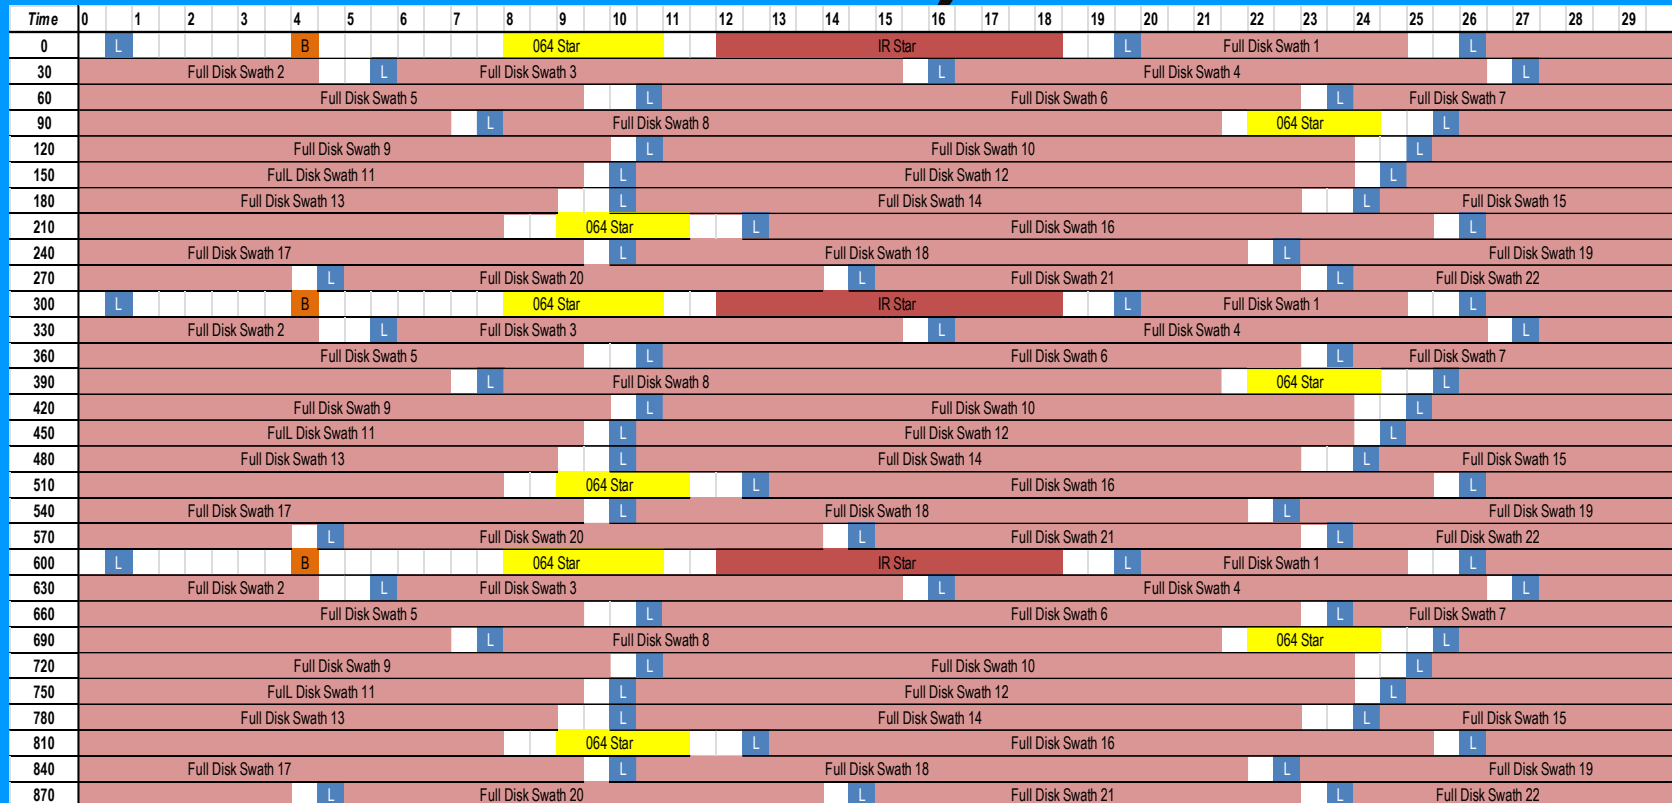

Mesoscale Domain Sector Request Priority List

1. SPC High or Moderate Risk
2. Volcanic ash eruption and plume directly over or approaching the US or US Territories
3. SPC Enhanced Risk
4. Hurricane warning(s) and/or watch(es) in effect for US or US Territories
5. Event or circumstance with national importance requiring elevated DSS (e.g... large outdoor sporting events, large hazmat event, radar outage with high-impact weather forecast, etc...)
6. SPC Extreme Fire Weather criteria or Incident Meteorologist (IMET) deployment for wildfire support
7. SPC Marginal or Slight Risk or Severe Thunderstorm or Tornado Warnings
8. SPC Critical Fire Weather or OCONUS Fire Weather Watch with at least one active wildfire occurring
9. WPC High or Moderate Risk of Excessive Rainfall or WFO issuance of Flash Flood Watch
10. 40% or greater tropical cyclone development in next 48hrs/recon flight scheduled in 12 hrs
11. LIFR Conditions (widespread) at Large and/or Medium FAA Hub Airports
12. Winter Storm Warning criteria (including blizzard and ice storm warning criteria)
13. Tropical Storm watch(es) and/or warning(s) in effect for US or US Territories
14. Hurricane watch(es) and/or warning(s) in effect for international land areas in NHC's area of responsibility
15. Two or more Tropical Storms (or Hurricanes) outside of the CONUS domain invoking a switch to Mode 4
16. Volcanic ash plume not directly over or approaching the US or US Territories
17. Two or more volcanic eruptions outside of the CONUS domain invoking a switch to Mode 4
18. Blowing dust or sand conditions with $\frac{1}{4}$ mile or less visibility
19. LIFR or worse conditions (widespread) over small FAA Hub Airports
20. Winter Weather Advisory criteria
21. SPC General Thunder
22. Other NWS requests
23. DoD requests

Feedback should be directed to Mike Bettwy, NWSOC MIC

ABI Mode 4 -- (Continuous Full Disk)

This is the Continuous Full Disk (every 5 min) mode

This is the highest data rate. Only 1m 15s idle time each 15 minutes

Might be used in Single Satellite Mode

Mode 6

- This is being tested with GOES-17
- 10-minute Full Disks, 5-minute CONUS, 2 mesoscale sectors.
- A lot less idle time

GLM Mission Benefits

- Improved forecaster situational awareness and confidence resulting in more accurate severe storm warnings (improved lead time, reduced false alarms) to save lives and property
- Diagnosing convective storm structure and evolution
- Aviation and marine convective weather hazards
- Tropical cyclone intensity change

26th Great Lakes Operational Meteorology

Hurricane Katrina

What's Next with Getting GLM into NWS WFOs?

NWS WFO Preliminary Test & Evaluation (PT&E) to evaluate experimental GLM Flash Extent Density (FED) grids, transmitted via the LDM, began Thursday, April 26th.

PT&E WFOs: *HUN, MLB, LWX/ZDC, LUB, BOU/ZDV, HGX/ZHU, RAH, OUN, FWD/ZFW* (These are stations that had experience with LMAs in the past)

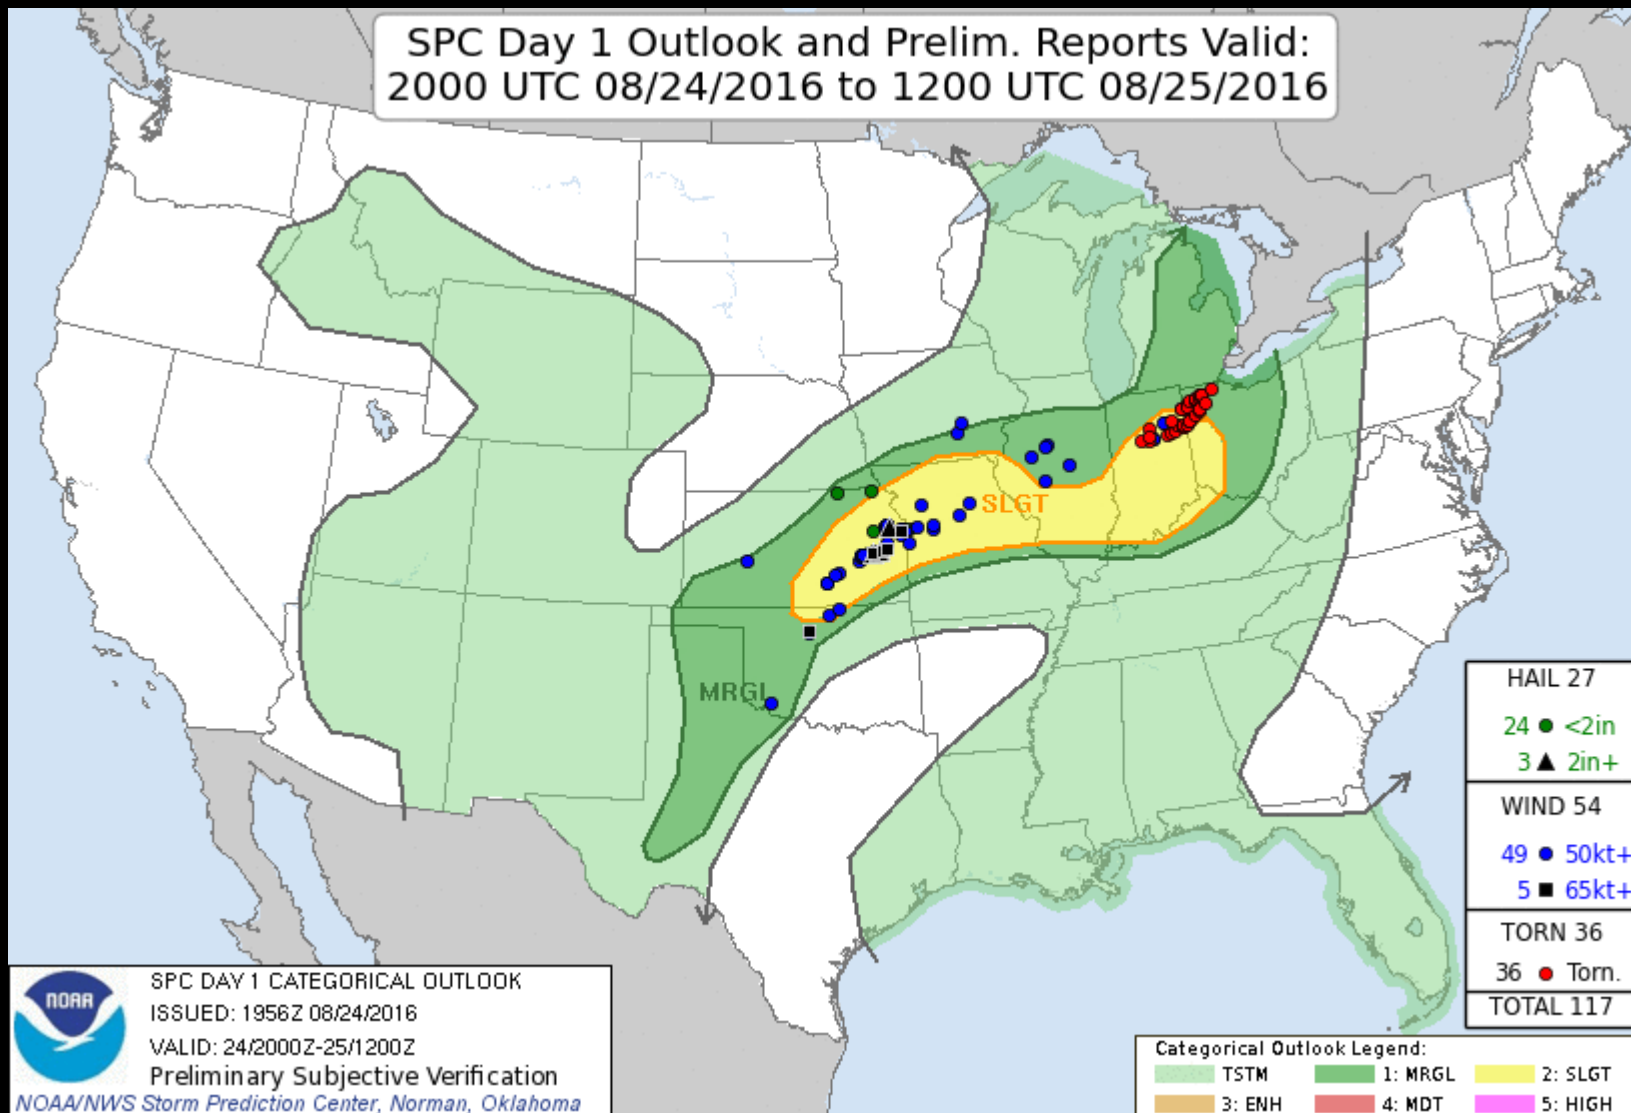

PT&E Goal: *To confirm stability of the experimental GLM grids with respect to missing data, latency, AWIPS performance, and AWIPS display.*

If the PT&E is successful, details about a wider rollout of the GLM FED to all WFOs via the LDM will be communicated in mid May.

The operational GLM FED Product is tentatively scheduled for dissemination to WFOs via the SBN in September 2018.

The goal: Prevent Surprises!

Convection is Possible?

- Visible and IR for situational awareness
 - Boundaries at surface and in 3 water vapor channels!
 - Is Moisture changing? How can satellite help?
 - Split Window Difference
 - Derived Stability Indices
 - Moving Boundaries
- Convection is starting
 - Mesoscale Sector for 1-minute imagery
 - Make requests often! Acquire the “Office that Called the most Mesos” Badge and wear it proudly!
 - When does Glaciation occur? How are cloud-tops cooling?
 - ProbSevere?
 - GLM?

Convection is Possible?

GOES-16 Gives Flexibility

- Choose the product that you like, and use it
 - Understand any limitations
- Derived Stability Indices
 - 10-km resolution
 - Adjustment to GFS initial field, and ABI doesn't offer much in the way of temperature information, but it does give moisture information
- Split Window Difference
 - Highlights moisture, but also changes in boundary layer

GOES-16 Gives Flexibility

GOES-16 Gives Flexibility

10.3 μm – 12.3 μm Water Vapor Absorption

Little cooling due to H_2O vapor absorption

More cooling due to H_2O vapor absorption

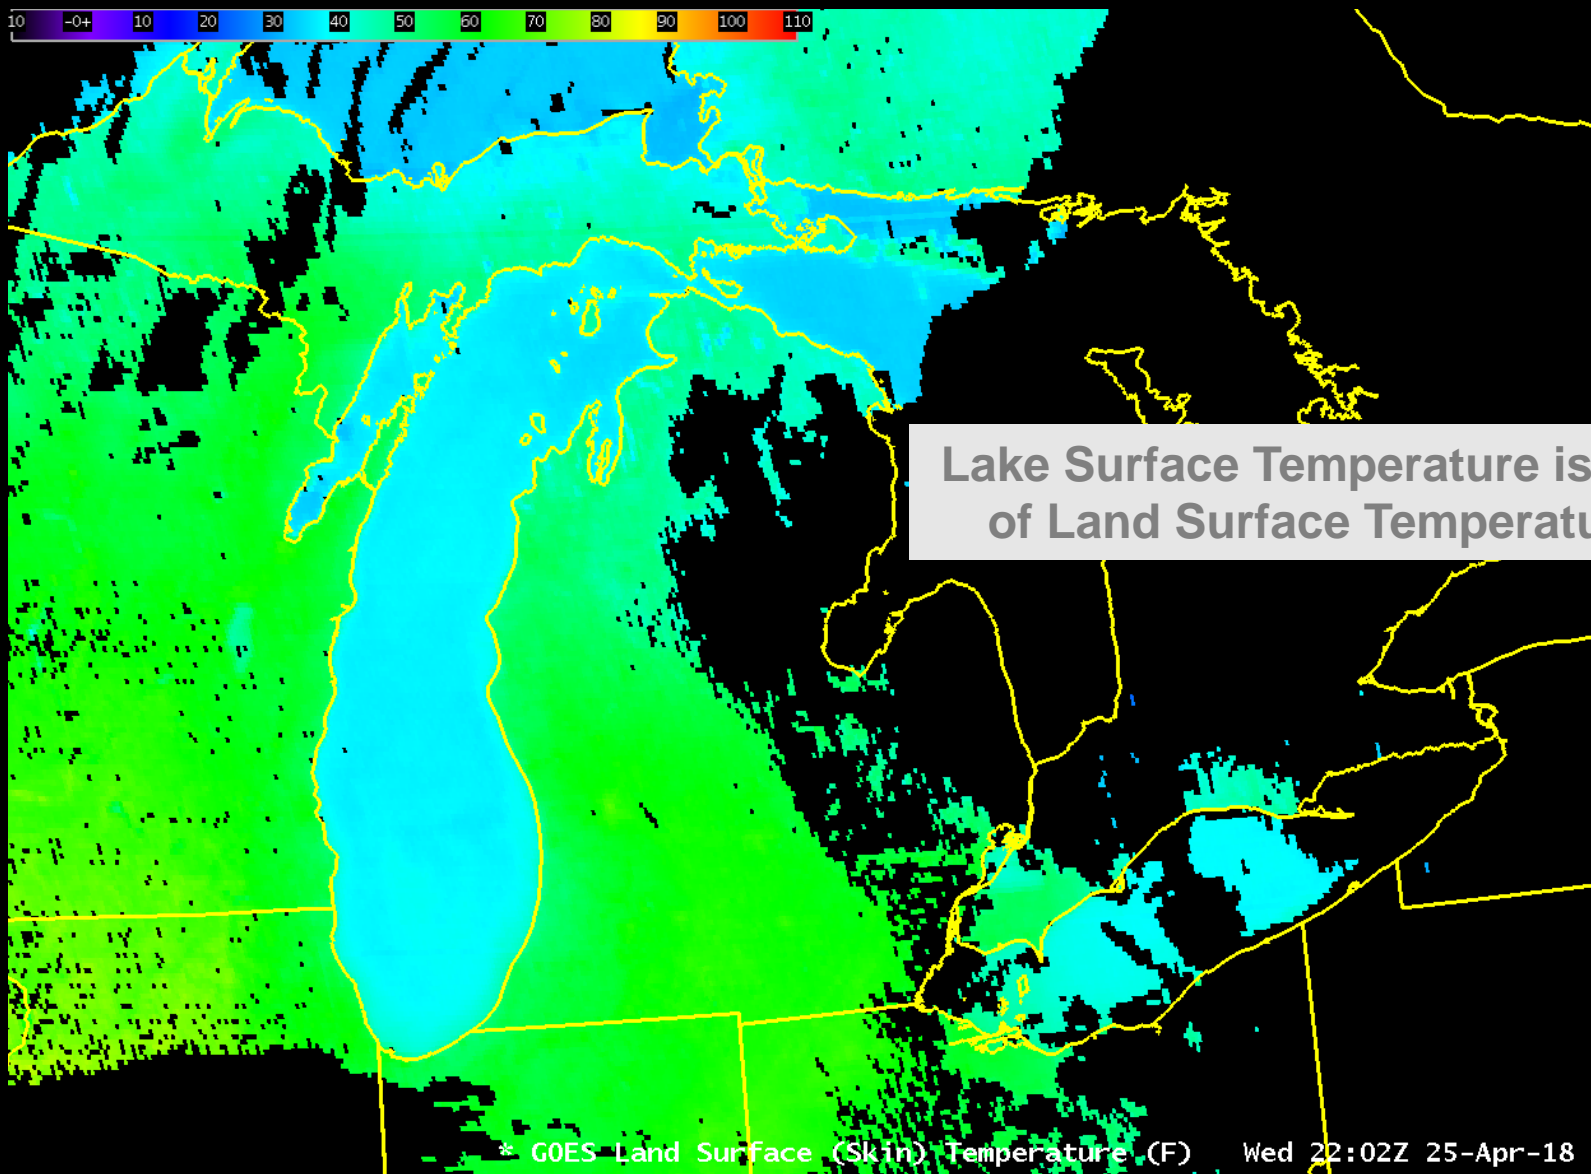

Split Window: Also sees dust (but not smoke)

Blowing Snow

- Can you use GOES-16 to see blowing snow?
- The image at left is from January 15th, from 1457-2257 UTC.
- (Thanks to Phil Schumacher/Tommy Grafenauer for this case)

Blowing Snow

- The Snow/Ice Channel ($1.61 \mu\text{m}$) has a brighter character in the region of blowing snow
- Particle Size effect?
Smaller crystals will be more reflective

Blowing Snow

- Day Fog Brightness Temperature Difference (10.3 – 3.9) shows a different value over the blowing snow
- More reflectance at 3.9 by small ice crystals

Blowing Snow

Snow Ice Difference

Mon 18:00Z 15-Jan-18
* GOES-16 CMIP CH-02-0.64um

Compelling visual imagery

The excellent temporal resolution makes timing estimates easy

* GOES-16 CMIP CH-02-0.64um Thu 15:02Z 08-Mar-18

New Channels, New Information

- (New to Geostationary, that is)

- 1.61 μm
 - My favorite! So many applications to use: snow/ice detection, glaciation in clouds,
- 1.37 μm
 - The 'cirrus' channel – indicates moisture content, to some extent, because water vapor strongly absorbs energy with this wavelength.

* GOES-16 CH-04-1.38um Wed 16:32Z 14-Mar-18

Choices in Fire Detection

- There are many ways to detect fires
 - 3.9 μm imagery
 - Fire RGB product that includes the 3.9 μm

A photograph of two technicians in white cleanroom suits and masks, looking at something off-camera. One technician is pointing towards the right.A photograph of a large, complex satellite component, possibly a solar panel array, being assembled or inspected in a cleanroom. Several technicians in white suits are visible around the component.

Thank you!

*Lockheed Martin

Some of the ABI images shown were during the pre-operational check-out period.
