# ROCHESTER, MINNESOTA CLIMATE 

Todd C. Rieck<br>National Weather Service<br>La Crosse, WI

## I. Preface

The purpose of this publication is to provide a comprehensive look at the climate for Rochester, Minnesota. It is hoped that the many facts and figures contained in this publication will provide information and insight for our many users, from the general public and media, to those with economic interests across the area.

All temperatures are in degrees Fahrenheit, and all precipitation records are measured in inches. Unless otherwise noted, normal records are for the period of 1971-2000, monthly and daily temperature and precipitation records date back to 1886, monthly snowfall back to 1908, and daily snowfall and snow depth back to 1948. All data is up-to-date through July 2002.

## II. Introduction

Rochester, Minnesota, is in the Zumbro River Valley. The south branch of the Zumbro River flows through Rochester. Within the city of Rochester three creeks flow into the south branch. Terrain around Rochester is rolling, and the elevation ranges from 1,000 to 1,300 feet above sea level.

The succession of high and low pressure systems over Rochester brings a variety of weather that is changeable. The weather pattern is continental with four definite seasons. Winters are cold, but summers are pleasant.

The season-to-season temperature variation is quite large. The average temperature for a warm winter is 20 degrees and for a cold winter it is 12 degrees. The average temperature for a warm summer is 70 degrees and a cold summer is 67 degrees, which indicates that summer temperatures are not as variable as those
 during the winter. The average growing season is about 140 days. Rochester lies near the northern edge of the influx of moisture from the Gulf of Mexico. Severe storms such as blizzards, freezing rain (glaze), tornadoes, wind, and hail storms do occur. During the five month growing season, May through September, the major crops of corn, soybeans, small grains, and hay are produced. During this period, the normal rainfall is over 18 inches, approximately 65 percent of the annual precipitation.

Snowfall averages above 45 inches per season, with the snow season usually beginning in November. However, the first inch or more of snow occurs by the latter part of October once out of every ten years.

Rolling terrain and the thunderstorm probability make the south branch of the Zumbro River and its tributaries susceptible to flash flooding. Some flooding can occur with the spring snowmelt. In some instances the snowmelt is complicated with moderate spring rainfall.
(This summary is derived from the National Climatic Data Center's annual summaries for Rochester)

## III. Annual Climate of Rochester

The climate of Rochester is highly continental with mild summers and very cold winters. The average annual temperature is 43.4 degrees Fahrenheit ( F ). July is the warmest month with an average temperature of 70.1 degrees while January is the coldest month with an average temperature of 11.8 degrees. The warmest temperature ever recorded in Rochester has been 108 degrees which occurred on the $14^{\text {th }}$ of July in 1936. The coldest temperature in the weather history of Rochester was 43 below zero back on January $7^{\text {th }}, 1887$.

Precipitation in Rochester averages a bit over 30 inches a year with nearly $70 \%$ of the annual precipitation falling during the spring and summer months from April through August. Annual precipitation has ranged from a maximum of 43.94 inches in 1990, to a low of 11.65 inches in 1910. The wettest months are normally in the summer with June through August all averaging just over 4 inches of rainfall. The winter months are normally the driest since snow usually contains only about 0.10 inches of water equivalent per inch of snowfall. January and February are therefore normally the driest months of the year with an average of around one inch of water equivalent precipitation each.

Average temperatures and precipitation for the four seasons are given in Table 1. For this purpose winter is defined as December through February; spring as March through May; summer as June through August; and fall as September through November.

|  | Average <br> Temperature | Average <br> Precipitation |
| :---: | :---: | :---: |
| Winter | 16.4 | 2.57 |
| Spring | 43.7 | 8.00 |
| Summer | 68.7 | 12.01 |
| Fall | 46.7 | 6.75 |

TABLE 1: Temperatures are in degrees, precipitation is in inches.
Average winter snowfall (measured July through June) in Rochester is 48.1 inches with the average monthly totals being fairly evenly distributed from December through March. December is on average the snowiest month with nearly 11 inches. December and March average close to 10 inches while February has about 8 inches. November and April average about 4 to 5 inches of snow. Measurable snow has been observed from early October to as late as early May.

The highest seasonal snowfall total for Rochester topped out at 84.6 inches in 1996-97. The highest snowfall for a month came a few years later, with 35.3 inches falling in December of 2000. The one-day record of 15.4 inches occurred on January $22^{\text {nd }}$ of 1982, and the least snowiest season was in 1967-68, with only 9.1 inches falling.

## IV. Seasonal Variations

Seasonal changes in southeast Minnesota are usually sharply defined. However, they do not correspond very well to either the official calendar seasons or the three month "meteorological seasons" as defined in the previous section. By any criteria, winter is the longest of the four seasons in Rochester while summer lasts somewhat longer than either spring or fall.

## A. Winter Weather

The true winter weather season normally begins in mid to late November and extends into late March. Periods of cold weather are still likely both before and after these dates but this four month plus period is the time when average temperatures are at or below freezing and most precipitation falls in the form of snow.

The average high temperature drops to the freezing mark on the $27^{\text {th }}$ of November and stays at freezing or below until March $2^{\text {nd }}$. The majority of days in mid winter have highs from the mid teens to around 30, although Arctic outbreaks may bring periods of frigid weather when high temperatures stay below zero for several days in a row. Rochester averages 36 nights per winter when the temperature falls to zero or below with 14 such nights usually occurring in January.

There are several tracks which storm systems may take to produce snow in southeast Minnesota. The heaviest snows usually develop when low pressure systems develop in the southern plains states and move northeastward into Missouri and Illinois. These storms often produce 6 to 10 inch snowfalls and may cause snows in excess of one foot.

More common are the lows which track southeastward from Alberta, Canada and the northern plains states toward the Upper Mississippi Valley. These lows, known as "Alberta Clippers", typically produce lighter snows in the 1 to 4 inch range. Widespread blowing and drifting of snow may occur with these systems if the area of low pressure is strong. This is because the moisture content of the snow tends to be lower with these systems, leading to "lighter" or "drier" snow, which is moved more easily.

The Rochester area will experience freezing or mixed precipitation when cold high pressure is in place at the surface and a warm front approaches the region from the south. The warm air is forced to rise, causing liquid precipitation to freeze as it falls into the cold air. Bouts with freezing rain are not that common, but can occur a few times a winter season, generally at the start or end of the "winter".

Winter is, on average, the cloudiest season of the year in Rochester with lengthy periods when low clouds cover the sky. These clouds are typically stratus or stratocumulus which develop on the western side of storms which cross the upper Midwest. Clear weather in the winter is most likely to occur when a fresh dry Arctic air mass moves south from Canada into the Midwest.

The prevailing wind directions during most of the winter are from the northwest, with average wind speeds around 13 mph.

## B. Spring Weather

Spring weather normally begins around the end of March and can extend into early June, at which time the average high temperature has reached the lower to middle 70s. Thus, a typical spring lasts just slightly over two months but may seem much shorter when cold weather lingers into April and parts of May.

Average high temperatures in the spring rise from near 50 degrees at the beginning of April to the lower 70s by the end of May. Average lows rise from near 30 to near 50 during the same time interval. Freezing temperatures are common during the first half of April (averaging 13 for the month) when invading Canadian air masses are still very cold. The last frost is usually by the first or second week of May in the city of Rochester.

The jet stream gradually moves northward as spring progresses but the track of surface lows are often still to the south of Minnesota, especially in April. Significant snows are still possible when polar air is in place over the upper Midwest and lows track through the central Mississippi valley. Severe weather becomes more likely when the lows begin to track further to the north of Rochester later in the spring. The frequency of thunderstorms increases during the spring with an average of three days with thunderstorms in April and six such days in May.

Spring is, on average, the windiest season of the year and April is usually the windiest month in Rochester. This is
largely due to the strong temperature difference at this time of the year, when the polar regions are still cold but the southern U.S. has warmed up significantly.

## C. Summer Weather

Summer typically lasts about three months in Rochester, extending from early June through the first week in September. After the very changeable spring weather, summer usually features consistently mild to warm temperatures in this part of Minnesota. The average high temperature is near 80 degrees from the 19th of June through August 17th. While Rochester will never be considered a "hot" spot, it does average about 8 days when the mercury reaches the 90 degree or greater mark. However, there are years when temperatures do not top 90 .

Summer is normally the wettest of the seasons in Rochester due to the increased frequency of thunderstorms, with each "summer" month averaging 4 inches or greater of precipitation. There are usually around 20 days with thunderstorms, with June and July the most active.

Despite the greater precipitation, summer is probably the sunniest season of the year in Rochester. On average, Rochester is clear to partly cloudy $63 \%$ of the time during the summer, as opposed to the other seasons, which average less than $50 \%$. Summer is also the least windy of the seasons with average speeds a bit above 10 mph . The prevailing wind direction is from the south.

## D. Fall Weather

Fall weather typically begins by the second week in September and lasts until the first part of November. Fall is therefore another short season, lasting just a little longer than two months. Average high temperatures drop from the low 70 s in the beginning of September to the upper 50s by the middle of October. The cooling then accelerates during late fall with normal highs only around 40 degrees by the $12^{\text {th }}$ of November. Average lows fall from the low 50 s in beginning of September to the middle 20s by mid November. The average first frost in Rochester occurs during the end of September and start of October.

Average precipitation drops sharply from the summer to the fall, with October and November only averaging around or slightly above 2 inches. September is somewhat higher, averaging around 3 inches. This decrease is mainly due to the fact that tropical type air masses usually stay south of Minnesota in October and the likelihood of thunderstorms drops to around two days per month in Rochester.

While September and October are typically among the sunnier months in Rochester with an average of 9 clear days, November is the cloudiest month of the year. November only averages 5 clear days, with 19 cloudy days. So the chance to see some sunshine during November is only around $37 \%$, or close to one-third of the time. This increase in clouds is due to the onset of the winter season stratus clouds.

The first snowflakes of the season usually occur in October, as does the first measurable snow. However, the better chances for accumulating snows come in November, which averages over 5 inches for the month.

Wind speeds typically increase during the fall season with October and November having average speeds between 12 and 13 mph . The prevailing wind direction is still from the south, but northwest winds occur more frequently in November.

## V. Monthly Climatology

## A. January Climatology

January is the coldest month of the winter in Rochester. The average temperature for the month is 11.8 degrees Fahrenheit with an average daily high of 19.9 and an average low of 3.7. The warmest January on record occurred back in 1990 when the monthly mean temperature topped out at 25.8 . The coldest January was back in 1912 when the average for the entire month was 2.3 degrees below zero.

On average, temperatures fall to zero or below on 14 days during the month of January. The coldest temperature in the weather records for Rochester occurred on the $7^{\text {th }}$ of the month in 1887 when the mercury plunged to a frigid 42 degrees below zero. By contrast, the warmest January reading occurred in 1944 when it reached 58 on the $25^{\text {th }}$ of the month.

January is normally a very dry month with an average of only 0.94 inches of water equivalent precipitation. The wettest January was in 1886 with 4.40 inches of precipitation while the driest occurred in 1961 with only .07 inches.

An average January has around 10 inches of snow, tying it with December as the snowiest month of the year. The snowiest January on record was in 1996 when 30.2 inches fell, which is also the $4^{\text {th }}$ snowiest month all-time. January normally has 8 days with measurable precipitation but only 3 days of an inch or more of snowfall.

January is one of the cloudiest months of the year with an average of 7 clear, 7 partly cloudy, and 17 cloudy days. The amount of daylight does begin to increase during January, with total possible minutes increases from 8 hours 59 minutes on the 1 st to 9 hours and 49 minutes on the 31 st.

The average wind speed in January is 13.0 mph with the prevailing direction from the northwest.

## B. February Climatology

February is the $3^{\text {rd }}$ coldest month of the year in Rochester, around a degree warmer than December. The average temperature for the month is 18.4 degrees with an average daily high of 26.2 and an average daily low of 10.6. The coldest February occurred in 1936 when the average temperature was just barely above zero, at 0.5 degrees. The warmest occurred in 1931 when the monthly average was at freezing (32.0 F).

An average February has 9 days when the mercury falls to zero or lower and also has 18 days when the high temperature stays at or below freezing. The record low for the month is 39 degrees below zero, on the $20^{\text {th }}$ in 1929. The warmest February temperature on record is 63 degrees on the 17th in 1981.

An average February has around 8 inches of snow, making it the least "snowiest" out of the typical winter months. However, February is also a shorter month. February is the driest month of the year with an average of only 0.75 inches of melted precipitation. The wettest was in 1915 when 2.30 inches of precipitation fell while the driest was in 1964 when only 0.04 inches occurred. The snowiest February occurred in 1959 when 19.4 inches fell while the least snowiest was in 1920 when no measurable snowfall was recorded.

An average February has 7 clear days, 6 partly cloudy days, and 15 cloudy clear days. The amount of daylight also increases sharply, from 9 hours and 52 minutes on the first of the month to 11 hours and 10 minutes on the 28th.

The average wind speed is 12.5 mph with the prevailing direction from the northwest.

## C. March Climatology

March is the "last" of the winter months in Rochester with the transition toward spring starting to occur by month's end. The normal high rises from freezing on the first to 47 on the $31^{\text {st }}$ while the average low increases from 17 degrees on the first to 29 by month's end. The monthly mean temperature for March is 30.6 degrees. The warmest March in the weather history of Rochester was in 1910 with an average temperature of 43.4 while the coldest occurred in 1888 with an average of 17.8 .

March still averages 2 days when the mercury drops to zero or lower and averages almost 10 days when the high temperature stays at freezing or below. The coldest March temperature in Rochester was 31 degrees below zero on the first in 1962 while the warmest reading was a balmy 82 degrees on the $24^{\text {th }}$ in 1910 . Below zero readings have occurred as late as the $31^{\text {st }}$ when the temperature fell to 2 below in 1934.

Average March snowfall is around 9 inches which makes it the 3rd snowiest month in an average Rochester winter. The snowiest March occurred in 1951 when 35.1 inches fell. The least snowiest March's occurred in 1981 and 1910 when only a trace of snow fell.

March averages 1.88 inches of melted precipitation which is about twice as much as either January or February. There are normally 10 days with measurable precipitation during the month. The wettest March was in 1888 with 4.02 inches while the driest was in 1910 with only a trace.

There are normally 6 clear, 7 partly cloudy, and 18 cloudy days in March. The amount of daylight increases rapidly, from 11 hours and 13 minutes on the first to 12 hours and 42 minutes on the $31^{\text {st }}$.

The average wind speed in March is 13.2 mph , tying it with November as the $2^{\text {nd }}$ windiest month on average for Rochester. The prevailing wind direction is northwest.

## D. April Climatology

April is the first full month of the short spring season in Rochester. Daily high temperatures are quite variable in April making the term "normal high" rather misleading. The average high rises from 48 degrees on the first to 62 on the $30^{\text {th }}$ of the month, while the average low warms from 29 degrees on the first to 40 at the end of the month. The normal mean temperature for the month is 44.7 degrees. Rochester's warmest April occurred in 1915 with an average temperature of 55.0 while the coolest April occurred in 1950 with an average of only 37.6 degrees.

The coldest temperature ever recorded in Rochester during April was 5 degrees on the $6^{\text {th }}$ in 1982. The warmest April temperature occurred on the $21^{\text {st }}$ and $22^{\text {nd }}$ in 1980 , with highs for both days reaching 91.

April average precipitation is 3.01 inches, which makes it wetter than any of the previous months but still drier than any of the following spring or summer months. There are normally 3 days with thunderstorms during April in Rochester. The wettest April occurred in 2001 with 7.30 inches of precipitation while the driest was in 1946 with only 0.46 inches.

Average snowfall in April is 4.0 inches, but heavy snows can occur. Rochester's snowiest April was in 1983 when 16.4 inches fell. Because of the transition from winter into the spring, there can be rather dramatic swings in the temperature and moisture content of the air, which can lead to "big" snow storms. The $2^{\text {nd }}$ snowiest day on record for Rochester took place in April, with 13.6 inches falling on the $26^{\text {th }}$ in 1988.

April averages 6 clear days, 7 partly cloudy, and 16 cloudy days. The amount of daylight continues to increase, with 12 hours and 45 minutes of possible sunshine on the first, climbing to 14 hours and 8 minutes on the $30^{\text {th }}$.

April is on average the windiest month of the year in Rochester with a mean wind speed of 13.7 mph . The strong temperature differences between the northern and southern parts of the U.S. and the resulting strong pressure forces are the main cause of these winds. The prevailing wind direction is from the northwest.

## E. May Climatology

May is the 2nd of the spring months in Rochester with temperatures normally much warmer than those seen in April. The normal mean temperature for May is 56.9 degrees which is about 12 degrees warmer than April. Cold periods do still occur though, resulting in frosts at times, and snow is still possible but rare. The normal high rises from 62 degrees on the first to 73 on the $31^{\text {st }}$ while the normal low increases from 40 degrees on the first to 51 at the end of the month. Rochester's warmest May occurred in 1934 with an average temperature of 66.2 degrees while the coolest was in 1888 with a mean temperature of 49.6 degrees.

The highest temperature ever recorded in Rochester during May was 106 deg on the $31^{\text {st }}$ in 1934. That is the only occurrence of 100 degree temperatures in May in Rochester's recorded weather history, and also outdistances the second warmest May day by 10 degrees. The coldest temperature recorded in May was 21 degrees on the $3^{\text {rd }}$ in 1967. Freezing temperatures are still possible throughout May as the latest occurrence of 32 degree temperatures in Rochester was on the $29^{\text {th }}$ of June in 1937.

May average precipitation is 3.53 inches. The wettest May in Rochester was in 1982 with 8.41 inches of precipitation while the driest occurred in 1934 with only 0.40 inches of rainfall. The maximum one day rainfall in May occurred on the $17^{\text {th }}$ in 2000 with 4.02 inches. Thunderstorms also become more frequent in May (normally 6 days) compared to earlier months.

While snow in May is very unlikely, measurable snow does fall about once every ten years. The greatest total occurred in 1944 with 2 inches. Most May snows have been either trace amounts or a few tenths of an inch.

May is slightly sunnier than April but still has more clouds on average than the summer months. There are normally 7 clear, 9 partly cloudy, and 15 cloudy days. Amount of daylight increases from 14 hours and 11 minutes on the first to 15 hours and 13 minutes on the $31^{\text {st }}$ as the summer solstice rapidly approaches.

The average wind speed for May is 12.4 mph , with the prevailing wind direction from the south.

## F. June Climatology

June is the first month of meteorological summer in the Rochester area even though the astronomical season doesn't officially begin until around the $21^{\text {st }}$. Average highs are in the 70 s for the entire month, rising from 73 degrees on the first to 79 on the $30^{\text {th. }}$ The average low rises from 51 on the first to 59 on the $30^{\text {th }}$. The normal mean temperature for the month is 66.1 degrees.

Rochester's warmest June was in 1933 with an average of 73.8 degrees while the coolest was in 1966 when the mean temperature was only 59.6 degrees. The warmest temperature ever recorded in June was 105 degrees on the $27^{\text {th }}$ in 1934 . The coolest June temperature was 31 degrees on the $9^{\text {th }}$ in 1937. There are usually 1 to 2 days with 90 degree or greater temperatures.

June is, on average, the third wettest month of the year in Rochester with 4.00 inches of precipitation, trailing July and August. Much of this rain is produced by thunderstorms and there are normally 7 days with storms during the month. The wettest June occurred in 2000 with 12.52 inches of precipitation, which also made it the wettest month out of any month on record for Rochester. The driest June was in 1910 when only a trace of precipitation fell. The heaviest one day total of precipitation in June was 4.81 inches on the $1^{\text {st }}$ in 2000.

June averages 7 clear, 11 partly cloudy, and 13 cloudy days. June features the longest possible amount of daylight in the year with a maximum of 15 hours and 28 minutes of possible sunshine for the $17^{\text {th }}$ through $23^{\text {rd }}$.

June is less windy than the preceding spring months with an average wind speed of 11.4 mph . The prevailing wind direction is from the south.

## G. July Climatology

July is the warmest month of the year in the Rochester area and marks the midpoint of the summer season. The normal mean temperature for the month is 70.1 degrees with an average high of 80.1 and an average low of 60.1 . The warmest annual high temperatures occur on the $16^{\text {th }}$ through $20^{\text {th }}$, when readings normally reach 81 degrees.

The warmest July occurred in 1936 with an average temperature of 77.6 degrees, which is also the warmest month out of any month for Rochester. The coolest was in 1992 with an average of only 64.2 degrees. The hottest temperature ever recorded in Rochester was 108 degrees, which occurred on the $14^{\text {th }}$ in 1936. The coolest temperature recorded in July was 40 degrees on the $17^{\text {th }}$ of the month in 1911.

Average precipitation in July is 4.61 inches which makes it the wettest month. The wettest July was in 1978 with 12.33 inches of precipitation while the driest was in 1946 with only 0.41 inches of rainfall. The greatest one day rainfall total in July was 7.47 inches on the $11^{\text {th }}$ in 1981. This is also the wettest day out of any day on record. On average, there are 8 days with thunderstorms.

July is likely the "sunniest" month in Rochester with an average of 8 clear, 12 partly cloudy, and 11 cloudy days. The amount of daylight begins to decline, however, with 15 hours and 24 minutes of possible sunshine on the first of the month decreasing to 14 hours and 37 minutes by the $31^{\text {st }}$.

The average wind speed in July is 10.1 mph with the prevailing wind direction from the south.

## H. August Climatology

August is the second warmest month of the year in the Rochester area with an average temperature of 67.7 degrees. The average high is 77.5 and the average low is 58.0. The normal high temperature drops from 80 on the first to 74 by the $31^{\text {st }}$.

The warmest August was in 1947 with an average temperature of 77.0 degrees, while the coolest was 63.2 in 1992 . The warmest temperature ever in a Rochester August was 100 degrees which occurred several times in the month. The most recent was on the $23^{\text {rd }}$ and $24^{\text {th }}$ of 1948 . The coolest temperature was 32 degrees, back in 1915 on the $30^{\text {th }}$.

Average August precipitation is 4.33 inches, making it the second wettest month for Rochester. As in the earlier summer months, most of this rainfall is associated with thunderstorm activity (normally 6 days during the month). The wettest August in Rochester was in 1979 with 9.52 inches of precipitation. The driest August was in 1841 with only 0.31 inches of precipitation.

August skies are normally quite sunny with an average of 9 clear, 11 partly cloudy, and 11 cloudy days. The amount of daylight continues to decrease, dropping from 14 hours and 35 minutes of possible sunshine on the first to 13 hours and 16 minutes on the $31^{\text {st }}$.

The mean wind speed in August is 9.8 mph making it the least windy month of the year. The prevailing wind direction is from the south.

## I. September Climatology

September marks the beginning of the autumn season in Rochester although the first ten days or so of the month usually still have summer-like temperatures. The normal mean temperature for the month is 58.9 degrees with an average high of 69.2 degrees and an average low of 48.7 degrees. The normal high drops from 74 on the first of the month to 64 on the $30^{\text {th }}$.

The warmest September occurred in 1908 with an average temperature of 69.6 degrees while the coldest was in 1974 at 54.7 degrees. The mercury hit the 100 degree mark once in September on the $6^{\text {th }}$ in 1913. The coldest temperature recorded in September was 22 degrees on the $28^{\text {th }}$ in 1942.

September starts the transition to the drier fall months, with an average of 3.12 inches. There are normally 5 days with thunderstorms during the month. The wettest September occurred in 1986 with 10.50 inches while the driest was in 1953 when only .33 inches of rain fell.

September is a little more cloudy than the preceding summer months with an average of 9 clear, 7 partly cloudy, and 14 cloudy days. The amount of daylight shortens considerably in September, from 13 hours and 13 minutes on the first of the month to 11 hours and 45 minutes by the $30^{\text {th }}$.

The average wind speed in September is 10.9 mph with the prevailing direction from the south.

## J. October Climatology

October marks the middle of the fall season in Rochester with average temperatures showing a marked decline from the beginning to the end of the month. The normal high drops from 64 degrees on the first to 48 degrees on the $31^{\text {st }}$ while the normal low drops from 43 to 31 at the end of the month. The normal mean temperature for October is 47.0 degrees with an average high of 56.9 and an average low of 37.1 degrees.

The warmest October occurred in 1963 with a mean temperature of 58.1 degrees while the coldest was in 1917 with an average of only 37.5 degrees. The warmest temperature ever in October was 93 degrees on the $3^{\text {rd }}$ in 1997. The coldest October temperature was 6 below zero on the $25^{\text {th }}$ in 1887 . This is also the earliest first occurrence (after the warm summer months) of a below zero day in Rochester's recorded history.

Average October precipitation is 2.20 inches which is quite a bit less than in the preceding warmer months. This is mainly due to the fact that tropical air masses which can hold more moisture are not that common in Rochester after midSeptember. However, the wettest October was also the $9^{\text {th }}$ wettest month ever in Rochester. This occurred in 1911 when 9.11 inches of rain fell. The driest October was in 1952 when only 0.01 inches of rain was observed. The first snowfall of the month usually occurs by late October (mostly trace amounts). October does average less than an inch of snowfall.

October averages 9 clear, 8 partly cloudy, and 15 cloudy days. The amount of daylight continues to drop rapidly with 11 hours and 42 minutes on the first, to 10 hours and 15 minutes on the $31^{\text {st }}$.

The average wind speed in October is 12.1 mph with the prevailing direction still from the south.

## K. November Climatology

The month of November marks the transition from fall to winter in southeastern Minnesota, as it does across much of the upper Midwest. The average temperature falls more rapidly in November than it does in any other month. The normal high temperature at Rochester drops 17 degrees from 48 on the first to 31 on the $30^{\text {th }}$. The normal low plummets 14 degrees from 31 on the first to 17 on the $30^{\text {th }}$. Late November also marks the time when the first sub zero temperatures of the season are likely, although they can occur at any time during the month. November usually has one day with below zero readings.

During the month of November, the main polar jet stream usually migrates south of Rochester to a position over the central U.S. This migration allows developing storm systems to track further south than they do earlier in the fall. If these storms track through Iowa or the northern half of Illinois, Rochester is likely to experience some of its first measurable snows of the winter season.

The average temperature for the month of November is 31.2 degrees with an average high of 38.7 and an average low of 23.7. Rochester's warmest November occurred in 2001 when the average temperature was 45.2 degrees while the coldest November occurred back in 1985 with an average temperature of only 23.0 degrees. The all-time record high for the month is 77 degrees set on the first in 1983 while the record low is 24 degrees below zero in 1887 on the $28^{\text {th }}$.

Average November precipitation is 2.01 inches with a record maximum of 5.91 inches in 1909. The lowest monthly total is 0.01 inches, back in 1917.

November snowfall averages over 5 inches but amounts are highly variable from year to year. Many Novembers have seen only a trace of snow, but in 1985 Rochester established its record November snowfall of 22.5 inches. The one-day record of 10.6 inches on the $25^{\text {th }}$ in 1952 is also the $4^{\text {th }}$ snowiest day on record for Rochester.

November is the cloudiest month of the year in Rochester. A normal November has 5 clear, 6 partly cloudy, and 19 cloudy days. The amount of daylight also continues to decline, from 10 hours and 13 minutes on the first to 9 hours and 10 minutes on the $30^{\text {th }}$.

The mean wind speed in November is 13.2 mph , tying it with March as the second windiest month of the year. The prevailing wind direction shifts to the northwest.

## L. December Climatology

The month of December marks the first full month of meteorological winter in the Rochester area. The monthly mean temperature is 17.3 degrees with an average daily high of 24.5 and an average low of 10.5 degrees. December is also the month when below zero temperatures become more common, with an average of 9 sub-zero days occurring during the month. The coldest temperature ever in Rochester during December occurred on the $19^{\text {th }}$ in 1983 when the mercury plunged to 33 below zero, while the warmest December reading is 63 degrees on the $17^{\text {th }}$ in 1939 .

The coldest December ever was in 1983 when the average temperature was only 2.9 degrees, while the warmest occurred in 1931 with an average temperature of 30.6 . December and January are the only months when average temperatures never reach freezing ( 32 F ).

The average snowfall in Rochester during December is over 10 inches, making it and January the snowiest months. The average melted equivalent precipitation is, however, only 1.02 inches which actually makes December, on average, the 3rd driest month of the year. Total precipitation has ranged from a trace in 1943 to 2.83 inches in 1982. Snowfall has ranged from a trace in 1943 and 1913, to 35.3 inches in 2000. The 2000 snowfall is also the highest for any month on record. There are normally 3 days with one or more inches of snowfall.

December averages 6 clear, 6 partly cloudy, and 19 cloudy days. The amount of daylight is least in December, reaching the annual minimum of 8 hours and 54 minutes on the $20^{\text {th }}$.

The average wind speed in December is 12.8 mph with the prevailing wind direction from the northwest.

## VI. Acknowledgments

Dan Baumgardt, Science and Operations Officer at WSO-La Crosse, who proofed this publication and provided many helpful hints and ideas.

Jeff Boyne, Meteorologist at WSO-La Crosse, who helped research some of the data.

## VII. Sources

Much of the information was researched using "in-house" National Weather Service data bases and monthly climate summaries.

The Midwest Climate Center's online database for Rochester MN, which was used to research some of the data and statistics.

The International Station Meteorological Climate Summary CD ROM, Ver. 3.0 from March of 1995, was also used. This CD was jointed produced by the Fleet Numerical Meteorology and Oceanography Detachment, National Climatic Data Center (NCDC), and USAFETAC OL-A.

## Heat Waves and Cold Snaps

## Consecutive Days with 90 degrees or greater temperatures:

14 Days: July 5th-18th, 1936

- At or above 10012 times
- All time record high of 108 on the 14th
- Average high temperature was 102.1 degrees
- 11 record high temperatures

12 Days: July $21^{\text {st }}$-August $1^{\text {st }}, 1941$

- Did not reach 100 or greater
- Average high temperature was 93.7 degrees
- No records set

10 Days: June $18^{\text {th }}-27^{\text {th }}, 1943$

- Did not reach 100 or greater
- Average high temperature was 92.4
- No records set

July $21^{\text {st }}-30^{\text {th }}, 1916$

- Did not reach 100 or greater
- Average high temperature was 94.8 degrees
- Tied one record high temperature

9 Days: June $22^{\text {nd }}-30^{\text {th }}, 1934$

- At or above 100 twice
- Average high temperature was 96.4 degrees
- Two record high temperatures set or tied
- One record high low temperature set

## Consecutive days with 100 degrees or greater temperatures:

9 Days: July $9^{\text {th }}-17^{\text {th }}, 1936$

- Average high temperature was 103.9 degrees
- Record high temperature each day
- All-time record high on station of 108 on the $14^{\text {th }}$
- Part of a 14 day stretch of 90 degree or greater temperatures

3 Days: July $21^{\text {st }}-23^{\text {rd }}, 1934$

- Average high temperature was 100.7 degrees
- Record high temperature each day

## Number of days with 90 degree temperatures or greater

1) 381934
2) 331916
3) 321936
4) 311955
5) 301988
6) 291948
7) 261941
8) 251937
9) 241939

10231964
1949
1947

Consecutive days not reaching above freezing ( 32 degrees):
65 Days: December $19^{\text {th }}, 1978$ - February $21^{\text {st }}, 1979$

- Average high temperature was 11.2 degrees
- Average low temperature was -6.5 degrees
- Average temperature was 2.5 degrees
- Four record low temperatures set or tied
- Five record lowest high temperatures set or tied
- Low temperature did not climb above 0 on 44 days
- High temperature did not climb above zero on 12 days

51 Days: January $3^{\text {rd }}$ - February $22^{\text {nd }}, 1936$

- Average high temperature was 9.4 degrees
- Average low temperature was -10.1 degrees
- Average temperature was -0.1 degrees
- Five record low temperatures set or tied
- One record lowest high temperature
- Low temperature did not climb above 0 on 42 days
- High Temperature did not climb above 0 on 14 days

50 Days: December $8^{\text {th }}, 1981$ - January $26^{\text {th }}, 1982$

- Average high temperature was 15.7 degrees
- Average low temperature was -1.4 degrees
- Average temperature was 7.4 degrees
- One record low temperature
- Two record lowest high temperatures set or tied
- Low temperature did not climb above 0 on 27 days
- High temperature did not climb above 0 on 8 days

47 Days: January $8^{\text {th }}$ - February $23^{\text {rd }}, 1978$

- Average high temperature was 13.5 degrees
- Average low temperature was -6.2 degrees
- Average temperature was 3.9 degrees
- No record lows, or record lowest high temperatures were set
- Low temperatures did not climb above 0 on 39 days
- High temperatures did not climb above 0 on 4 days

45 Days: December $14^{\text {th }}, 1969$ - January $27^{\text {th }}, 1970$

- Average high temperature was 15.6 degrees
- Average low temperature was -2.1 degrees
- Average temperature was 7.0 degrees
- Two record low temperatures set or tied
- Three record lowest high temperatures set or tied
- Low temperature did not climb above 0 on 24 days
- High temperature did not climb above 0 on 9 days

## Consecutive days with temperatures not reaching above zero:

6 Days: January $22^{\text {nd }}-$ January $27^{\text {th }}, 1936$

- Average high temperature was -5.0 degrees
- Average low temperature was -23.3 degrees
- Average temperature was -14.0 degrees
- One record low temperature
- Four record low high temperatures

5 Days: January $30^{\text {th }}-$ February $3^{\text {rd }}, 1996$

- Average high temperature was -12.4 degrees
- Average low temperature was -27.4 degrees
- Average temperature -19.6 degrees
- One record low temperature
- Four record low high temperatures

January $1^{\text {st }}$ - January $5^{\text {th }}, 1970$

- Average high temperature was -6.0 degrees
- Average low temperature was -22.0 degree
- Average temperature was -13.8 degrees
- Two record low temperatures
- Two record low high temperatures

January $17^{\text {th }}-$ January $21^{\text {st }}, 1970$

- Average high temperature was -7.8 degrees
- Average low temperature was -27.4 degrees
- Average temperature was -17.4 degrees
- Two record low temperatures
- Two record low high temperatures

Number of days with the HIGH temperature at or below zero

1) 141936

1917
3) 131979
4) 121963
5) 111982
6) 101994

1972
1970
9) 91996

1971
1965
1918

## Number of days with the LOW temperature at or below zero

1) 631978
2) 561937
3) 541917
4) 531985

1950
6) 521951
7) 501972
8) 491963

1936
10481977

## January 29th - February 4th, 1996

Over 162 consecutive hours with below-zero temperatures.

## Seasonal Mean Temperature Records

## Fall

Average is 46.7 degrees

Note: Snowfall records date back to August 1, 1952. Rainfall records date back to 1909, including 188689 (but missing 1931-50).

## Dry and Wet Periods

## Most Consecutive Days without any MEASURABLE* precipitation:

57 Days: $\quad$ November $9^{\text {th }} 1943$ - January $4^{\text {th }} 1944$

- 11 days with a trace (11/9,11/10,11/12,11/25,11/26,11/28,12/05,12/11,12/12,12/26)

52 Days: $\quad$ February $22^{\text {nd }}-$ April $14^{\text {th }} 1910$

- 5 days with a trace (2/22, $2 / 24,2 / 26,3 / 1,3 / 29)$

50 Days: $\quad$ November $3^{\text {rd }}$ - December $22^{\text {nd }} 1910$

- 7 days with a trace $(11 / 4,11 / 14,11 / 27,12 / 5,12 / 6,12 / 7,12 / 18)$

44 Days: $\quad$ May $23^{\text {rd }}-$ July $5^{\text {th }} 1910$

- 2 days with a trace (5/28, $6 / 12$ )

36 Days: $\quad$ October $25^{\text {th }}-$ November $29^{\text {th }} 1914$

- 4 days with a trace (11/2, 11/12, 11/15, 11/16)

## Most Consecutive Days with MEASURABLE* precipitation:

| 11 Days: | January $8^{\text {th }}-18^{\text {th }} 1999$ |
| :--- | :--- |
|  | • Only a total of 0.94 inches, but 15.2 inches of snowfall. |
|  | June $28^{\text {th }}-$ July $8^{\text {th }} 1978$ |
|  | • Total of 9.26 inches |
|  | - A record of 6.22 inches on July $5^{\text {th }}\left(2^{\text {nd }}\right.$ wettest day on record $)$. |
|  | September $12^{\text {th }}-22^{\text {nd }} 1965$ |
|  | • Total of 3.20 inches. |
| 9 Days: | April $18^{\text {th }}-26^{\text {th }} 1996$ |
|  | • Total of 1.17 inches |
|  | July $14^{\text {th }}-22^{\text {nd }} 1978$ |
|  | •A total of 4.27 inches |

| Mean | 12.4 | 17.6 | 29.1 | 45.1 | 57.2 | 66.8 | 71.3 | 68.9 | 59.7 | 48.7 | 32.8 | 18.3 | 44.1 |

Note: These numbers are in reference to the percentage of time that the mean temperature is at or above the indicated temperatures.

Ex. >=40 is for mean temperatures from 40 degrees or greater. So in June, the daily mean temperature is 40 degrees or greater $100 \%$ of the time.

| 30 | 22 | 15 | 8 | 1 | -5 | -12 | -19 | -26 | -33 | -39 | -46 | -53 | -60 | -67 | -73 | -80 | -87 |
| 35 | 21 | 14 | 7 | 0 | -7 | -14 | -21 | -27 | -34 | -41 | -48 | -55 | -62 | -69 | -76 | -82 | -89 |
| 40 | 20 | 13 | 6 | -1 | -8 | -15 | -22 | -29 | -36 | -43 | -50 | -57 | -64 | -71 | -78 | -84 | -91 |
| 45 | 19 | 12 | 5 | -2 | -9 | -16 | -23 | -30 | -37 | -44 | -51 | -58 | -65 | -72 | -79 | -86 | -93 |

Wind chill is based on the rate of heat loss from exposed skin caused by the combined effects of the wind and cold. In other words, how cold it actually "feels". Ex. A wind speed of 15 mph with an air temperature of 10 above zero produce a wind chill of -7 degrees.

## Conversions:

Fahrenheit to Celsius

$$
C=5 / 9(F-32)
$$

Celsius to Fahrenheit $\quad F=9 / 5 C+32$
Miles per hour to knots: 1.15 miles per hour for every knot
1 inch of mercury = 33.865 millibars (mb)

## Heat Index <br> (Air Temperature vs. Relative Humidity)

| temp | $\mathbf{0}$ | $\mathbf{5}$ | $\mathbf{1 0}$ | $\mathbf{1 5}$ | $\mathbf{2 0}$ | $\mathbf{2 5}$ | $\mathbf{3 0}$ | $\mathbf{3 5}$ | $\mathbf{4 0}$ | $\mathbf{4 5}$ | $\mathbf{5 0}$ | $\mathbf{5 5}$ | $\mathbf{6 0}$ | $\mathbf{6 5}$ | $\mathbf{7 0}$ | $\mathbf{7 5}$ | $\mathbf{8 0}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| $\mathbf{8 0}$ | 73 | 74 | 75 | 76 | 77 | 77 | 78 | 79 | 79 | 80 | 81 | 81 | 82 | 83 | 85 | 86 | 86 |
| $\mathbf{7 5}$ | 69 | 69 | 70 | 71 | 72 | 72 | 73 | 73 | 74 | 74 | 75 | 75 | 76 | 76 | 77 | 77 | 78 |
| $\mathbf{7 0}$ | 64 | 64 | 65 | 65 | 66 | 66 | 67 | 67 | 68 | 68 | 69 | 69 | 70 | 70 | 70 | 70 | 71 |

The heat index is an accurate measure of how hot it really feels when relative humidity is added to the actual air temperature. Ex. An air temperature of 90 degrees, combined with a relative humidity of $60 \%$, would make it feel more like 100 degrees.

[^0]:    * More than a trace of precipitation.
