

# Ensembles, Anomalies, and Analogs

Michael Buchanan

Science and Operations Officer

National Weather Service Corpus Christi

# Quick NWP refresher

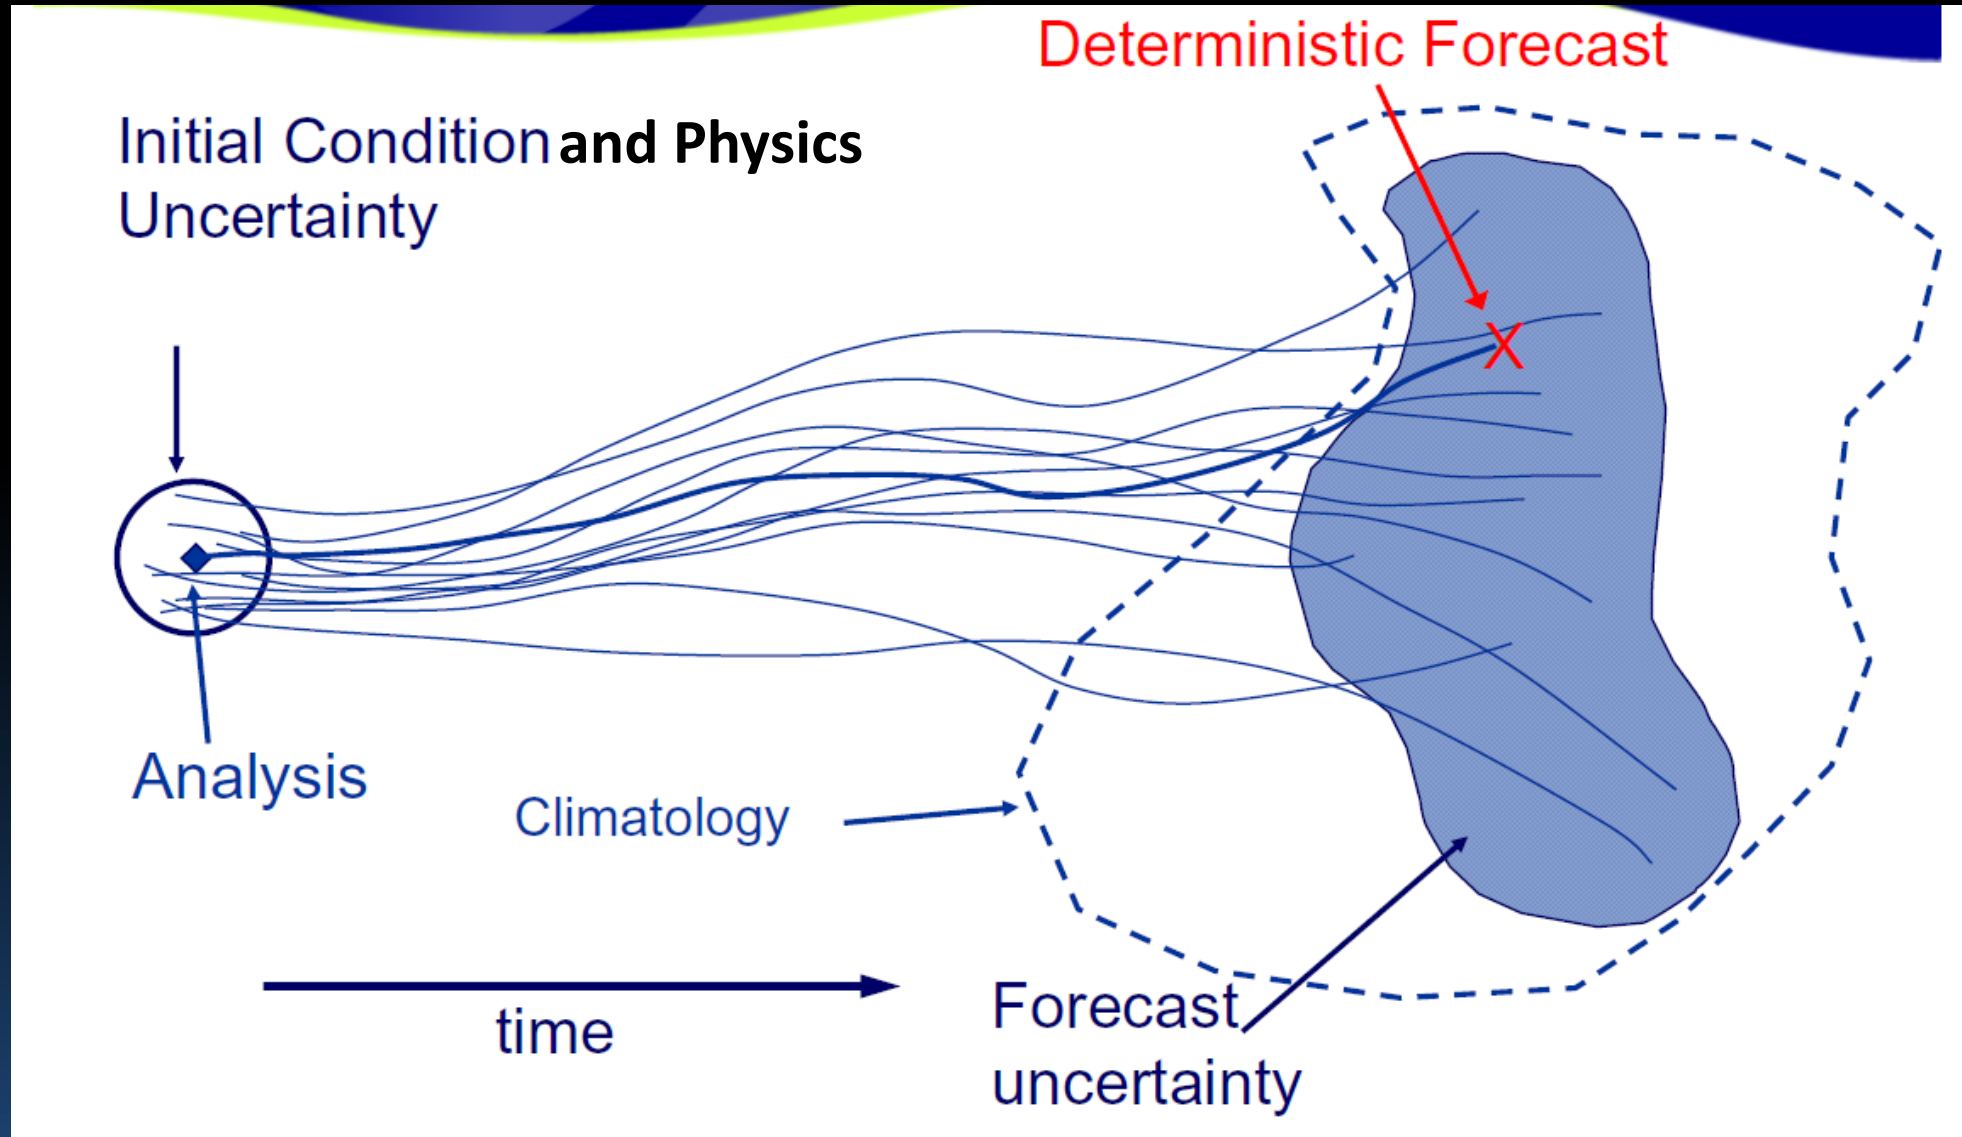

- Exact initial state of the atmosphere is NOT known!
  - Approximated through data assimilation.
- Errors can then grow with time.
- “Sensitive dependence on initial conditions” (Lorenz).
  - Chaos Theory
- Limits of predictability.

# Range/Probability of “possible” outcomes

- Perturbed initial conditions will lead to a range of outcomes.
- Can also perturb the physics of the model.

# Basic concept of Ensembles

# Ensemble Advantages

- Attempts to cover the range of forecast possibilities.
  - Estimate the predictability for an event.
- Good agreement among members usually implies high predictability.
- Regardless of errors in initial conditions or varying physics, you can still get a similar forecast.

# Ensemble Challenges

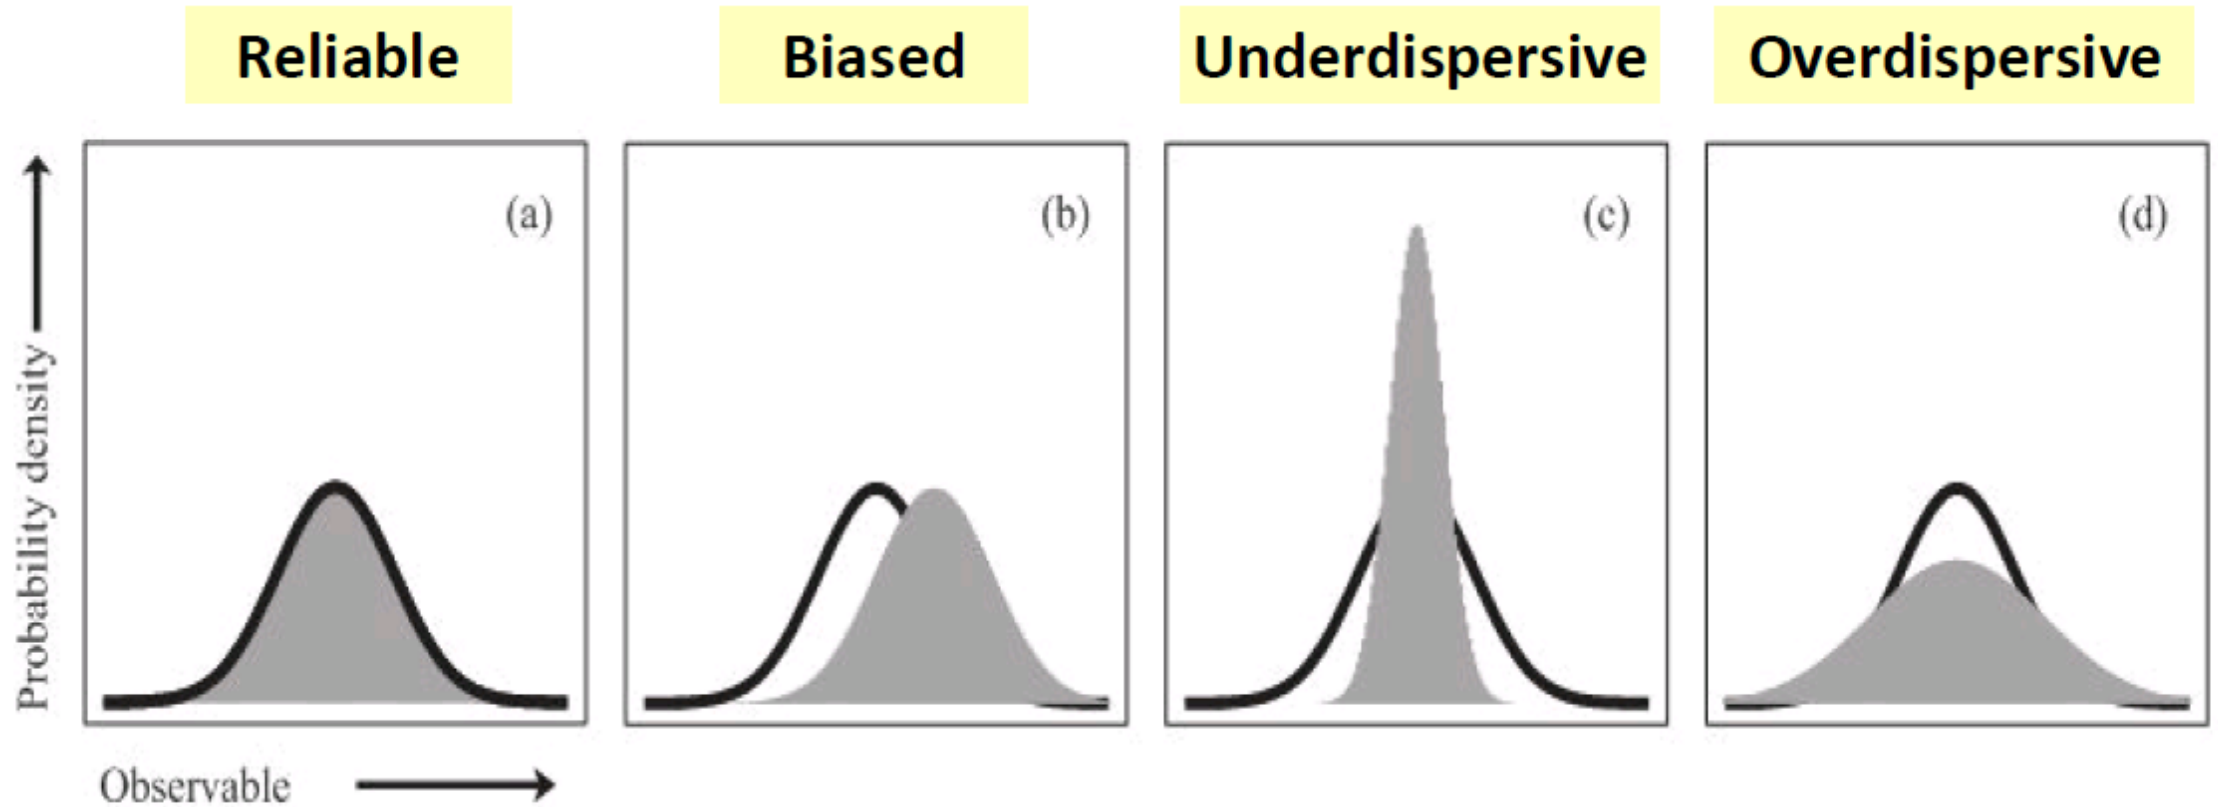

- Bias:
  - Perturb the initial conditions or physics all you want, but sometimes the model is just systematically too cold or too wet.
- Underdispersion:
  - Estimates of initial condition errors tend to be too small, and the real atmosphere may behave in ways completely outside the realm of our physics equations.
  - Result: **Ensemble doesn't have enough spread.**

# Bias/Underdispersion

### Tropical Depression Nine

Sunday August 28, 2016

5 PM EDT Advisory 1

NWS National Hurricane Center

### Current Information:

Center Location 23.7 N 81.7 W

Max Sustained Wind 35 mph

Movement W at 9 mph

### Forecast Positions:

● Tropical Cyclone ○ Post-Tropical

Sustained Winds: D < 39 mph

S 39-73 mph H 74-110 mph M > 110mph

### Potential Track Area:

Day 1-3

### Watches:

Hurricane Trop.Storm

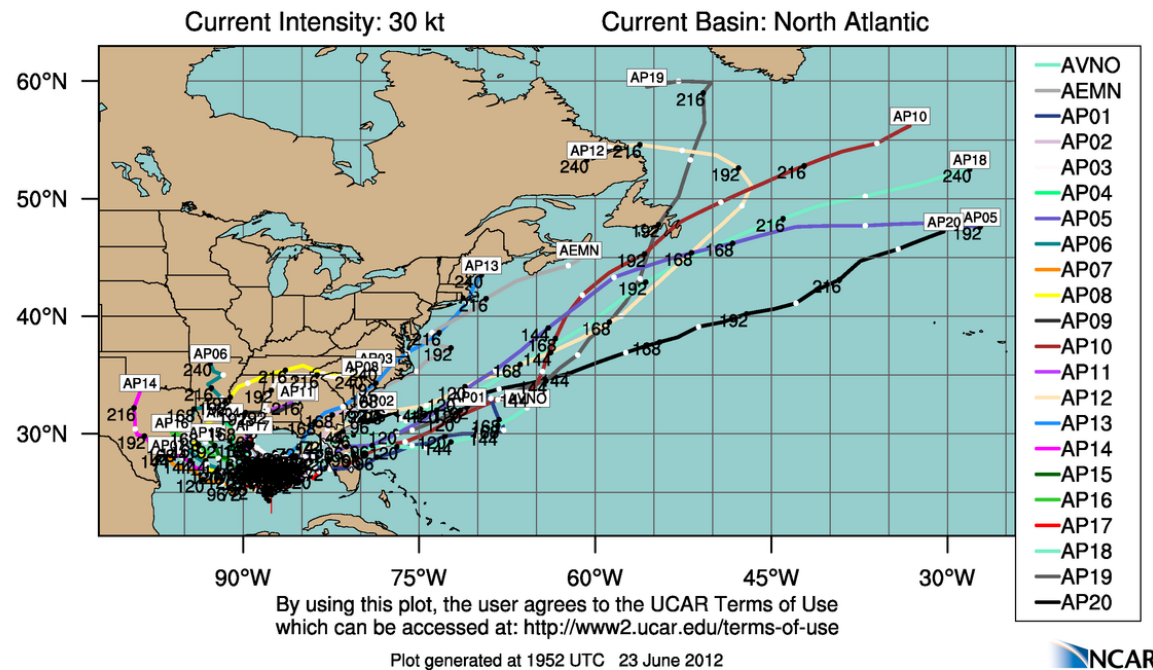

### Warnings:

Hurricane Trop.Storm

# Overdispersive – Tropical Storm Debby (2012)

## LOW INVEST (AL04)

NCEP GFS Ensemble track guidance initialized at 1200 UTC, 23 June 2012

# Types of Ensemble Forecast Systems (EFS)

- Same model but with different initial conditions.
- Same model but with different physics.
- A collection or “blend” of various models.

# Statistics Refresher

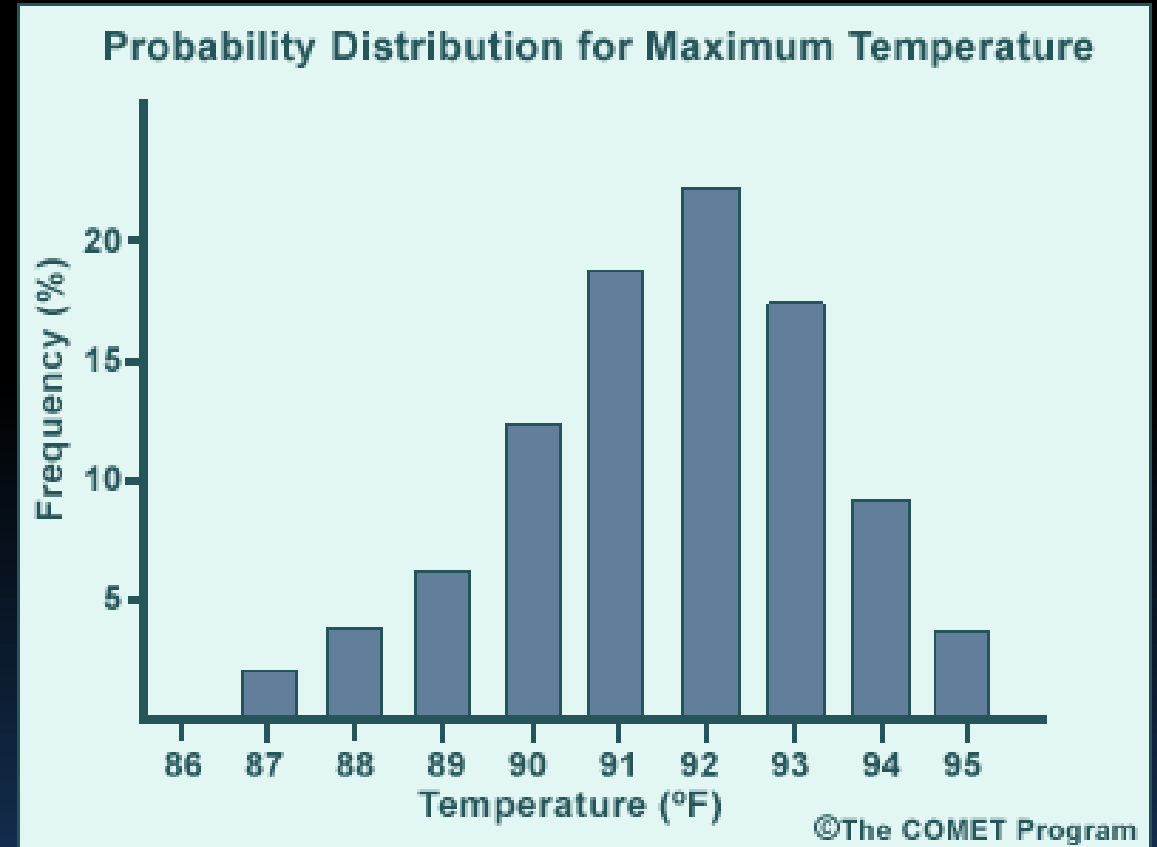

- Normal (Gaussian) Distribution.
- Standard deviation is a common measure of variability (dispersion).
  - Lower SD = closer to the mean.
  - Higher SD = further from the mean.
- Range is another measure of variability.
  - Difference between max and min value.

# Probability Density (Distribution) Function (PDF)

- From a PDF, a measure of variability can be determined.
  - **Spread** (i.e., Range)
  - **Standard Deviation**
  - **Percentile**
  - Probabilities of Exceedance

# Ensemble Mean and Spread

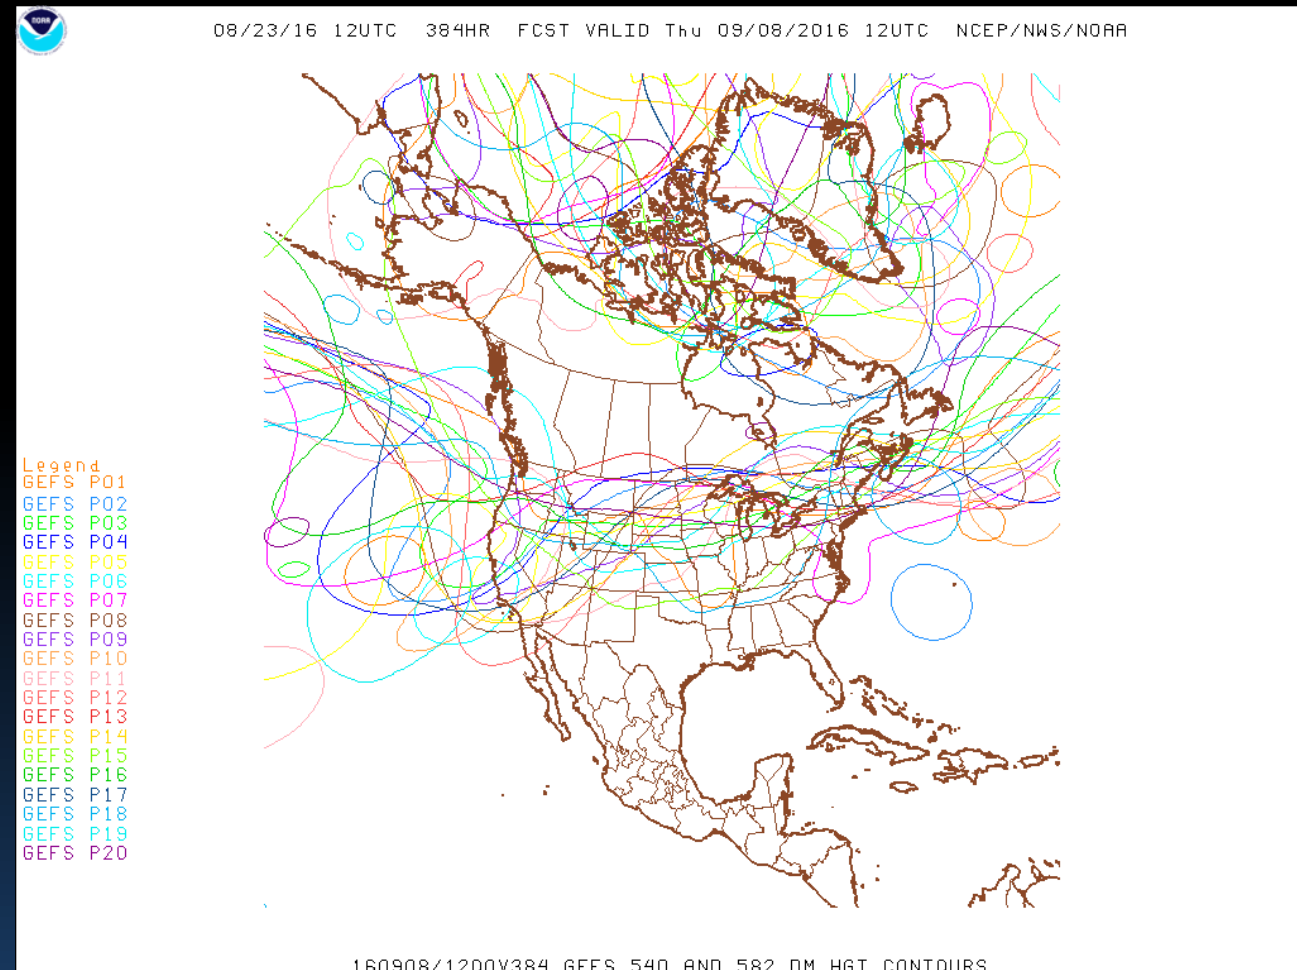

- **Mean** is the average of all members.
- **Spread** is the difference between the high and low member.
- “Normalized” spread also takes into account recent forecasts.

Synoptic Scale EPS/EFS  
(Climate ensembles NOT covered)

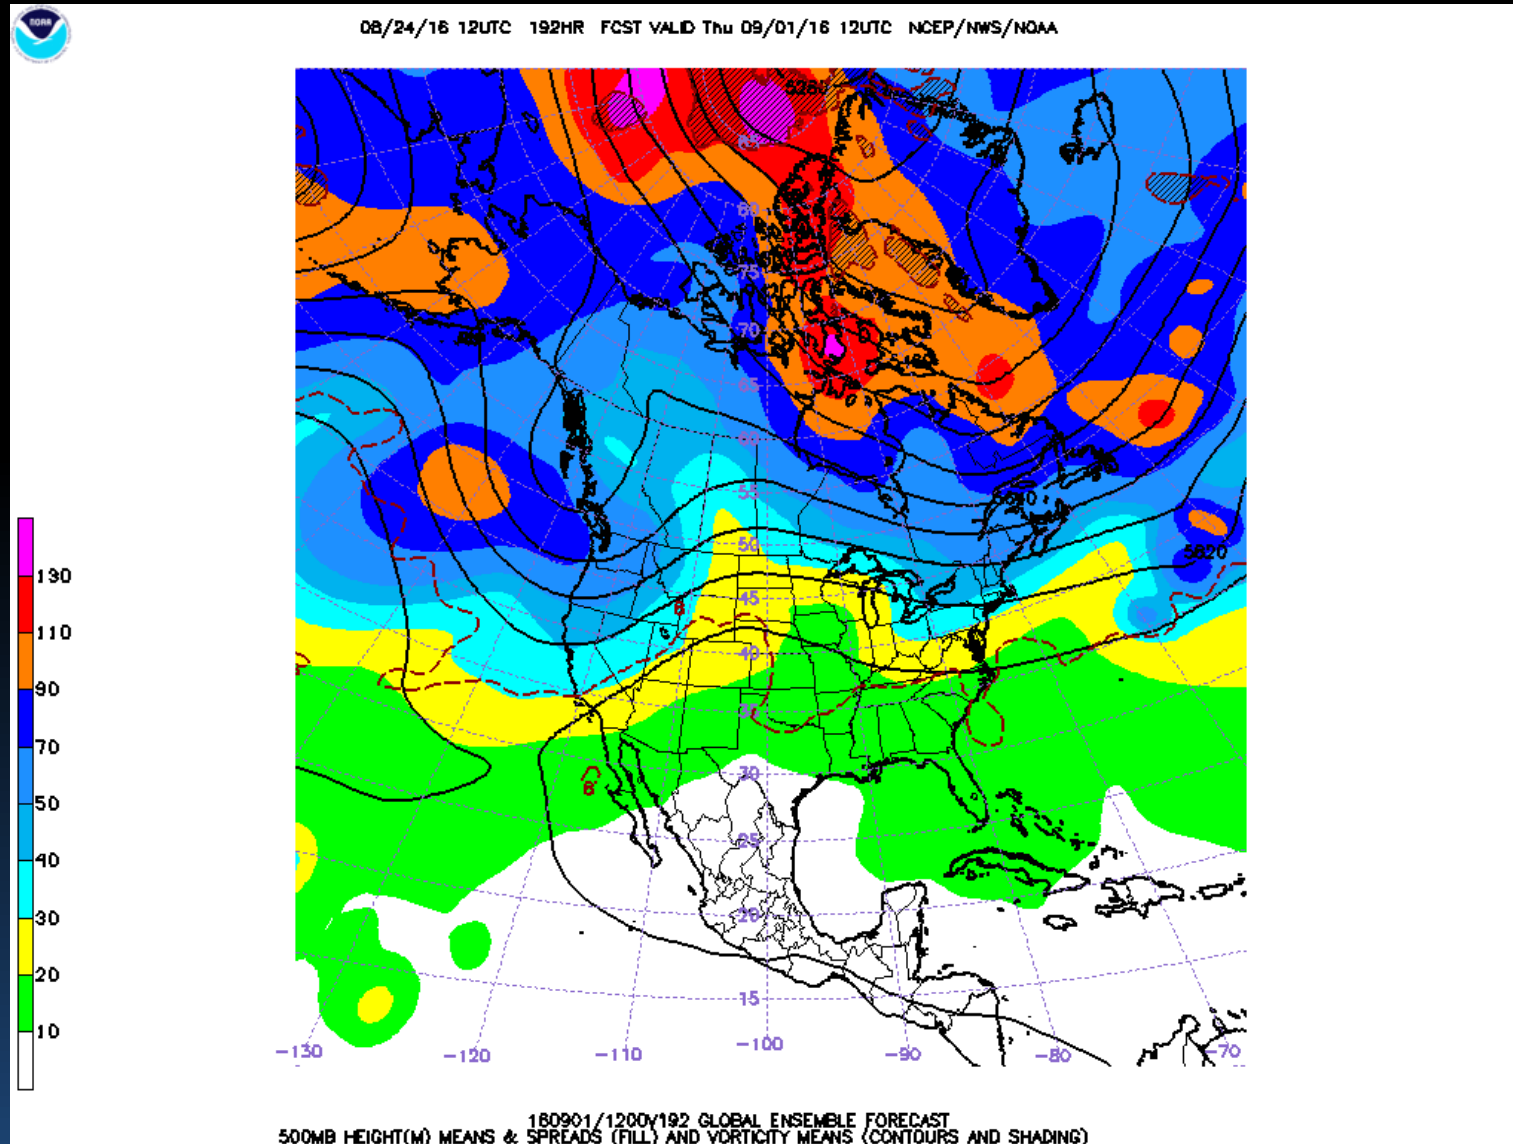

# Global Ensemble Forecast System (GEFS)

- GFS is the core model.
  - Run every 6 hours out to 16 days.
  - ~34 km 0-192 hours
  - ~55 km 192-384 hours
- 20 “perturbed” initial conditions result in 20 members.
- 1 control run uses the same initial conditions as GFS.

# Canada's Global Ensemble Prediction System (GEPS)

- Global Environmental Multiscale (GEM) model is the core model.
- Run twice a day out to 16 days.
  - ~50 km resolution
- 20 “perturbed” initial conditions & physics result in 20 members.
- 1 control run.

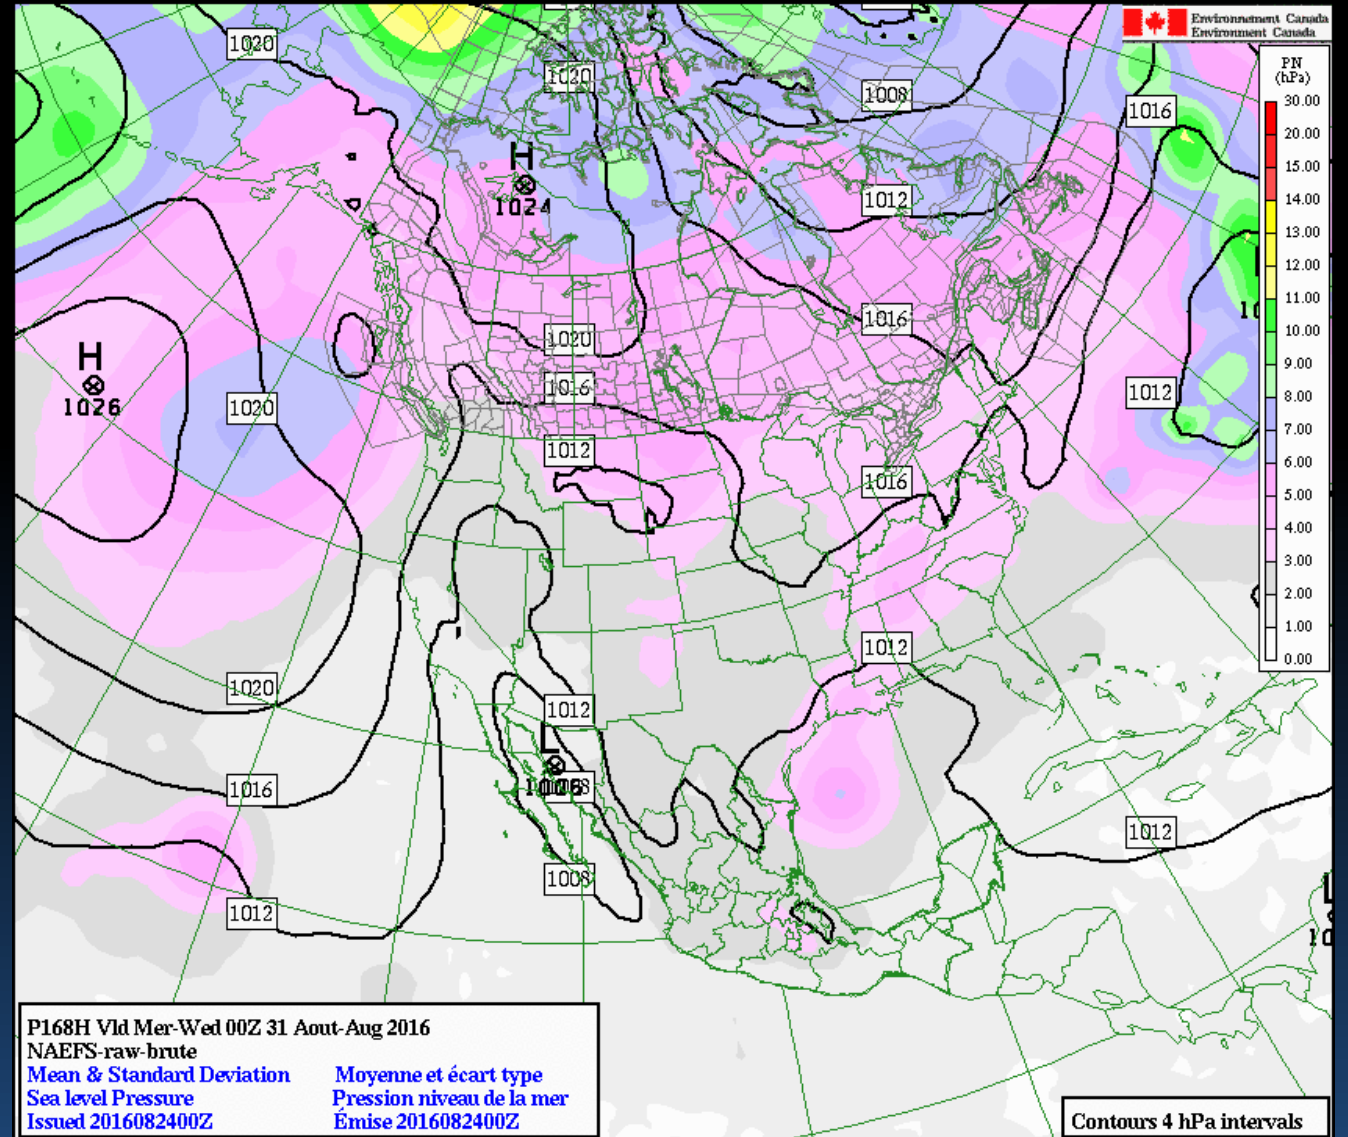

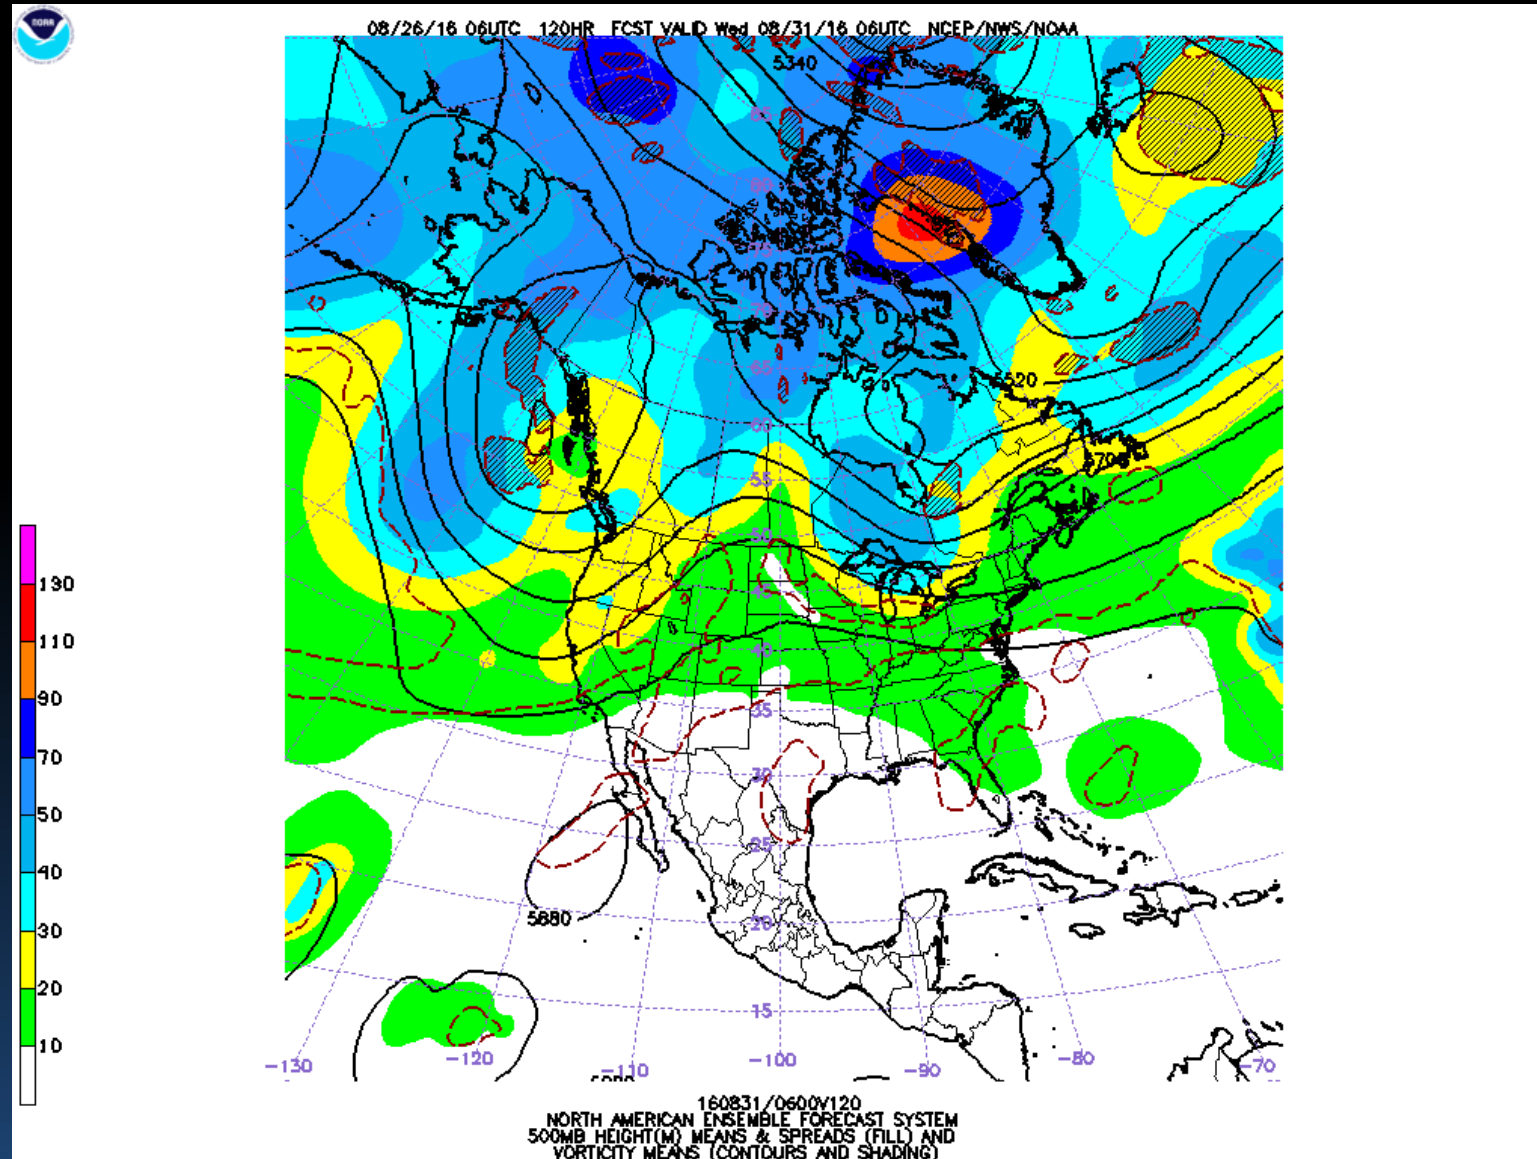

# North American Ensemble Forecast System (NAEFS)

- GEFS and GEPS combined.
- 42 total members including 1 control run from each EPS.
- Run every 6 hours out to 16 days.
  - Resolution  $1^{\circ} \times 1^{\circ}$  (lat/lon).

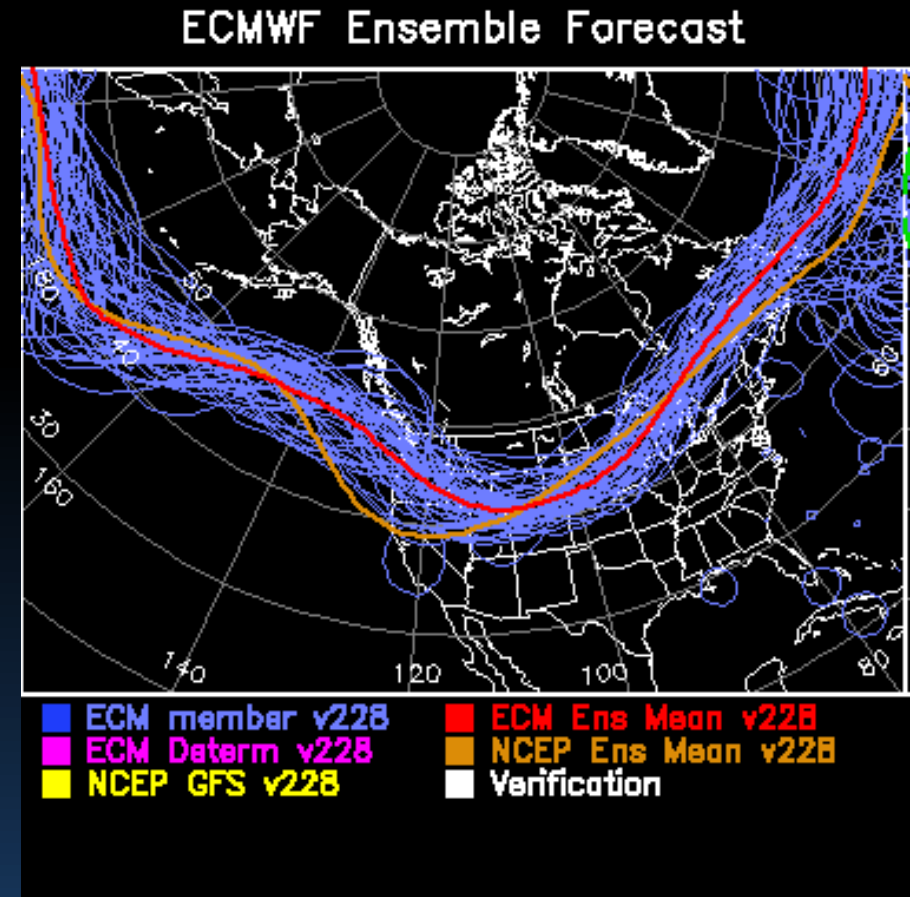

# NAEFS 500 mb Mean & Spread

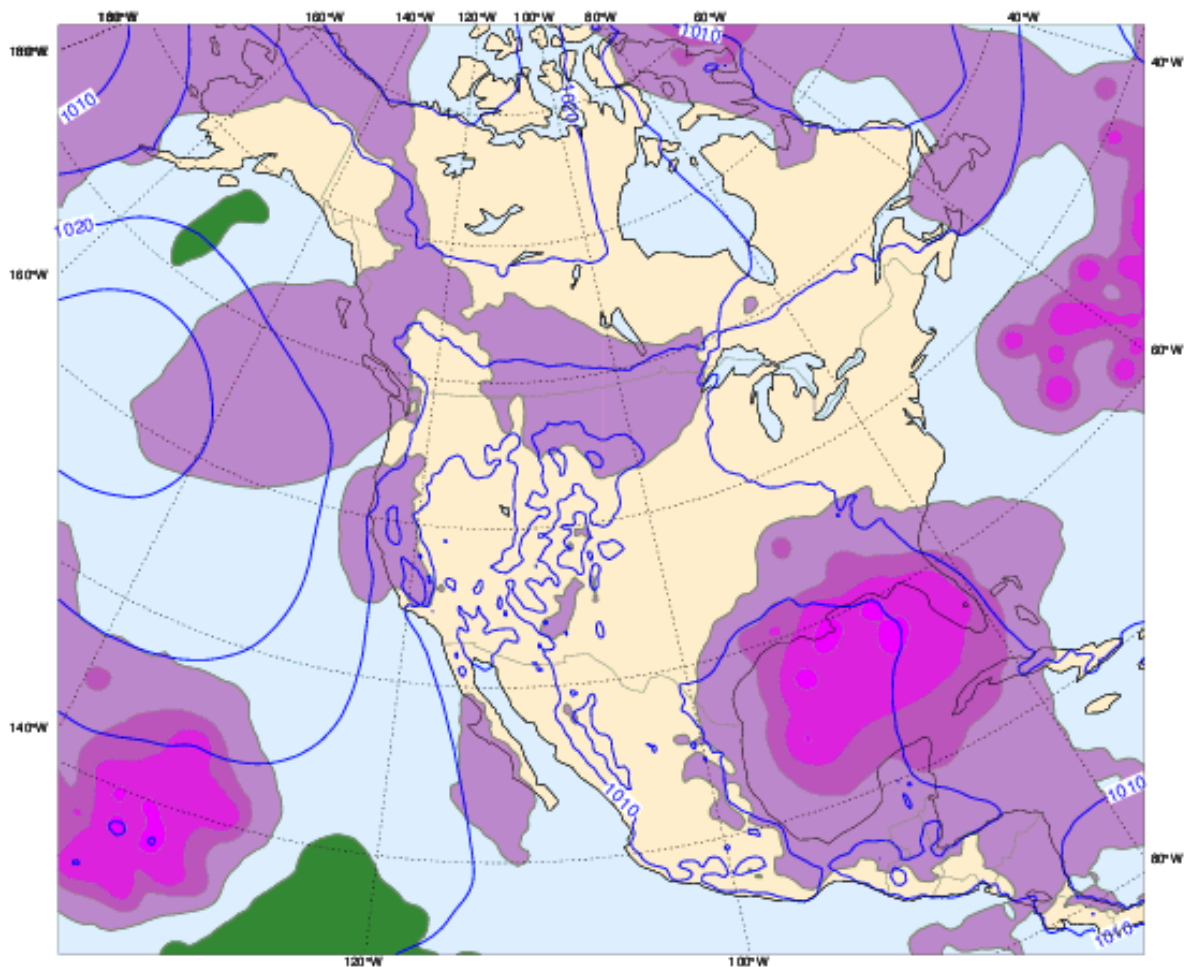

# ECMWF Ensemble

- Run twice a day through 15 days.
  - ~18 km resolution.
- 50 perturbed initial conditions & physics result in 50 members.
- 1 control run.
- 1 high-resolution (HRES ~9 km) run through 10 days.

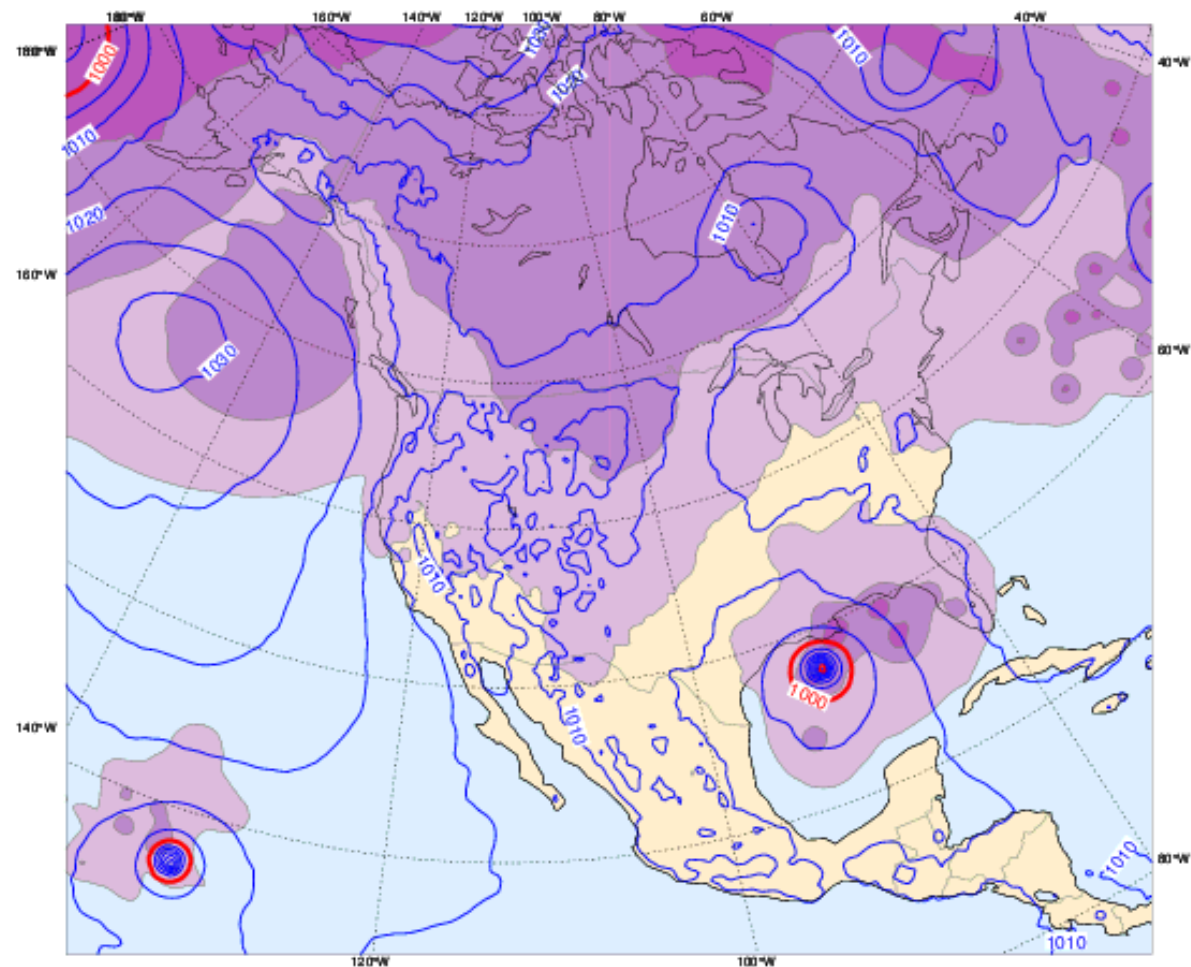

# ECMWF Ensemble MSLP (Mean and High-Res)

Wed 24 Aug 2016 00UTC @ECMWF Forecast T+168 VT: Wed 31 Aug 2016 00UTC

 Member with lowest range: 18

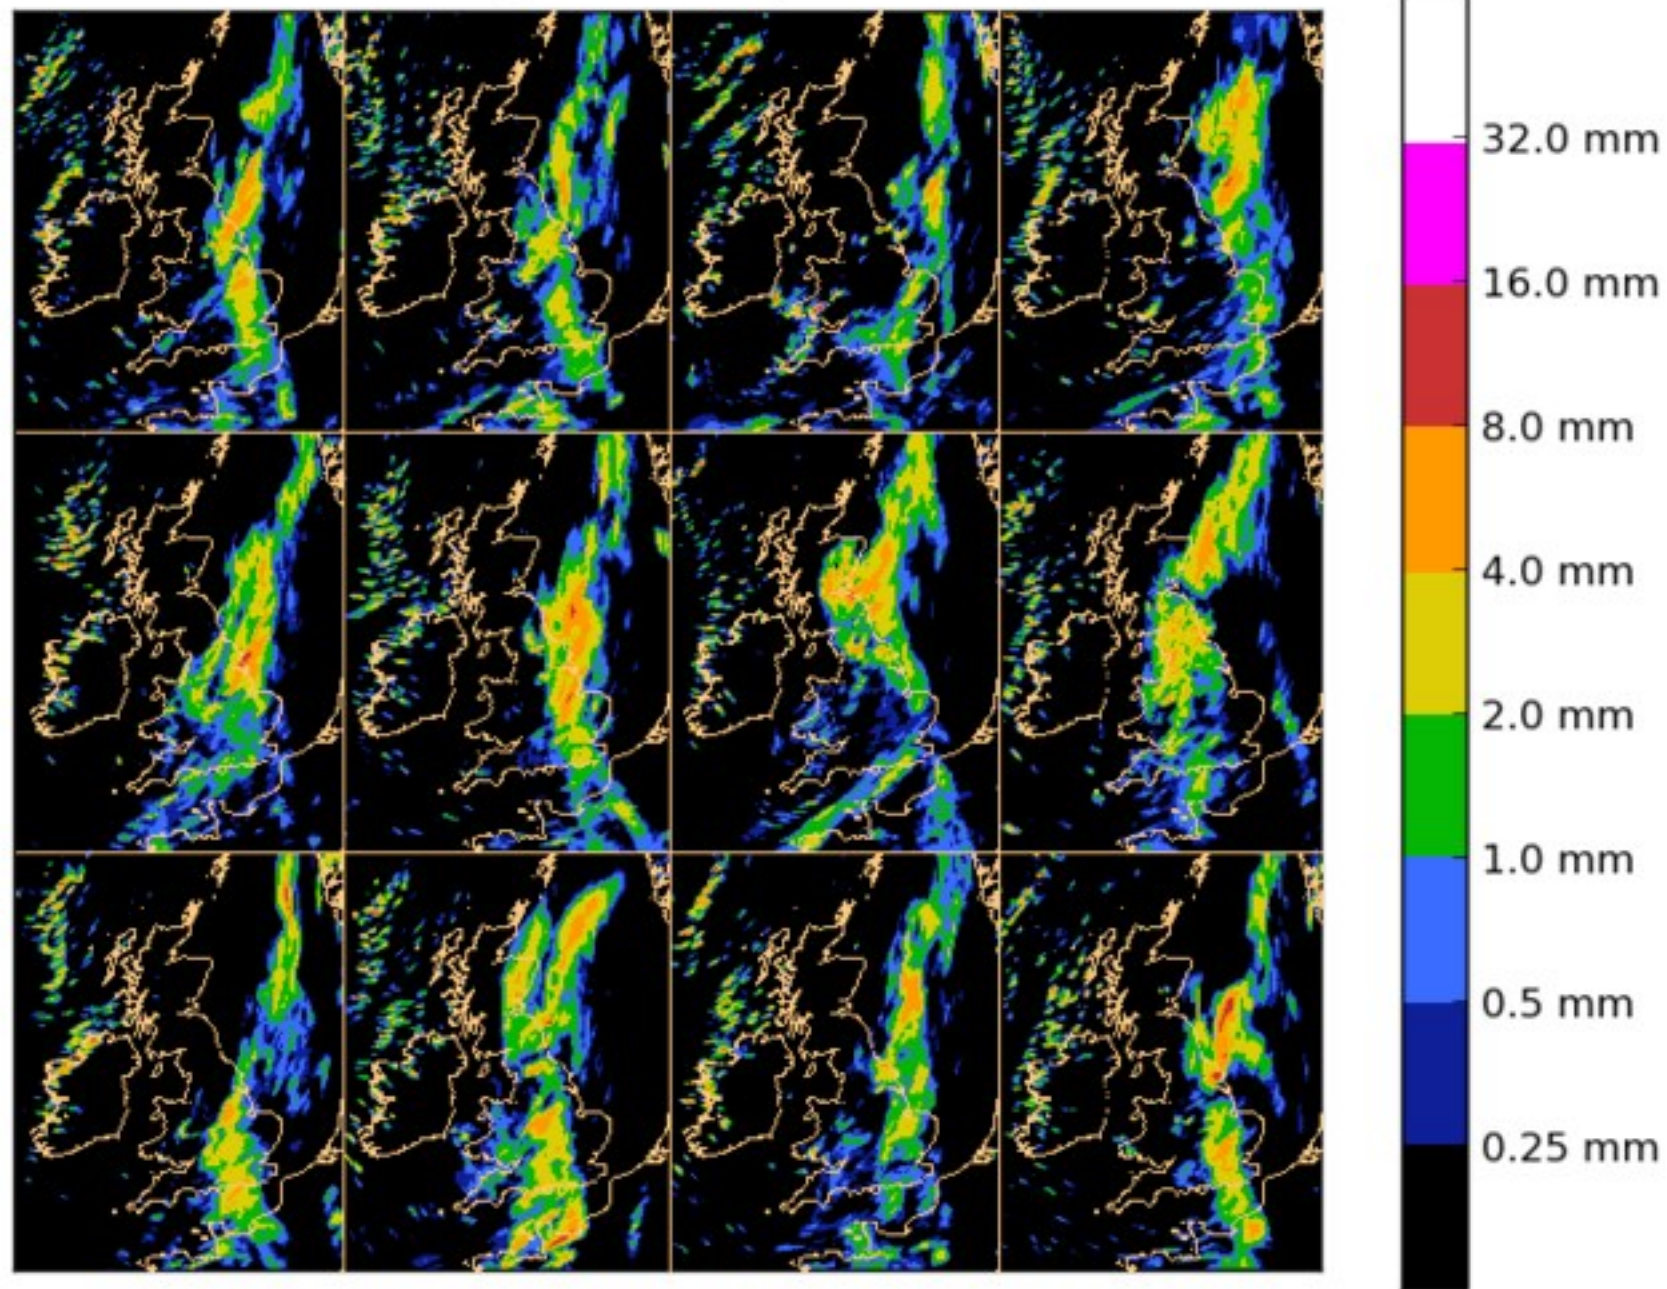

# UK Met Office Global and Regional Ensemble Prediction System (**MOGREPS**)

- 12 members per EPS.
  - 33 km resolution for Global
  - 2.2 km resolution for Regional (UK)
- Run every 6 hours.
  - Through 7 days for Global
  - Through 36 hours for Regional

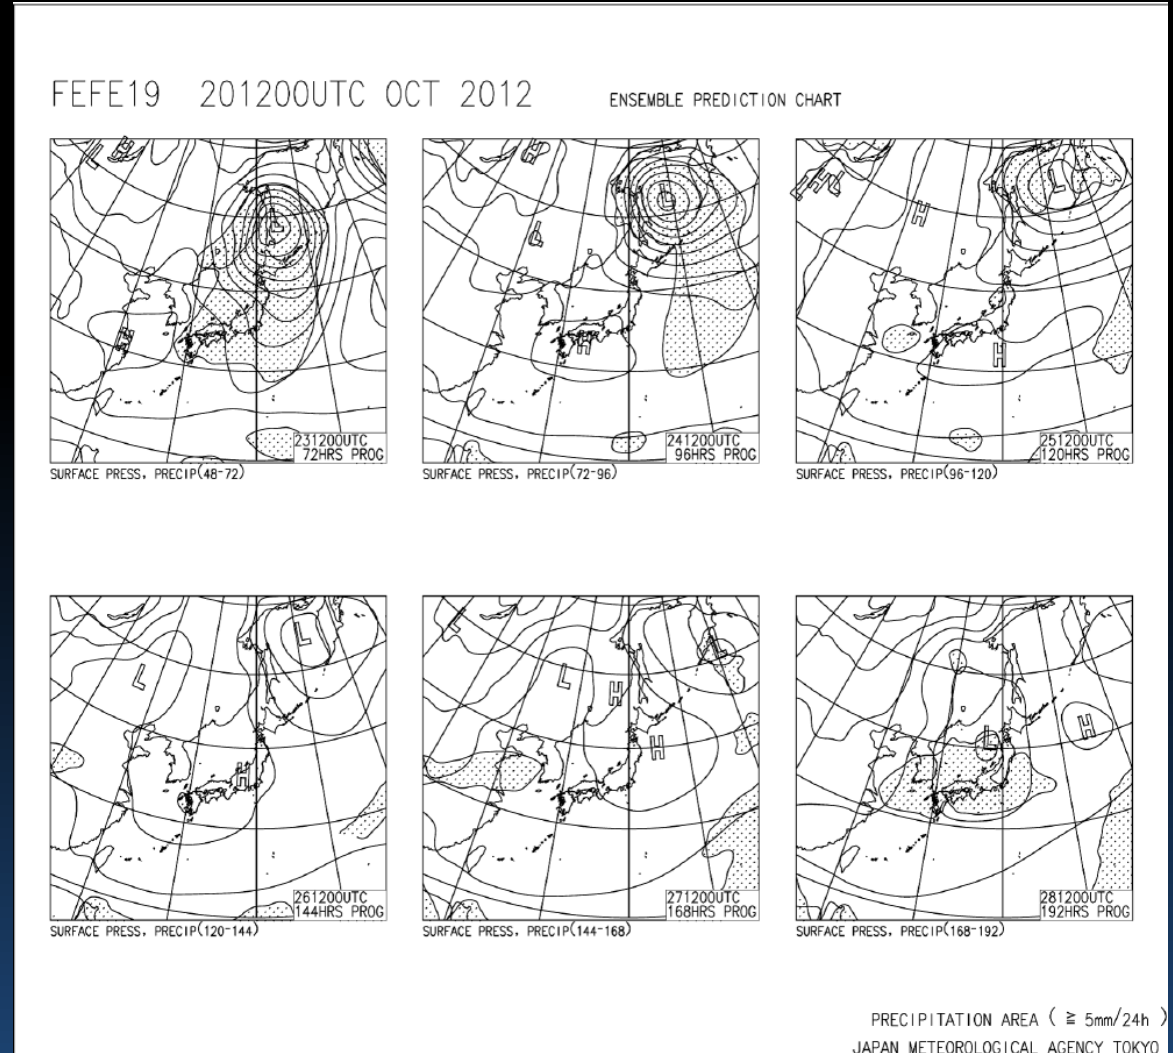

M-UK 1 Hour Precip Accum. for period ending: 06Z 05/07/2014 T+33

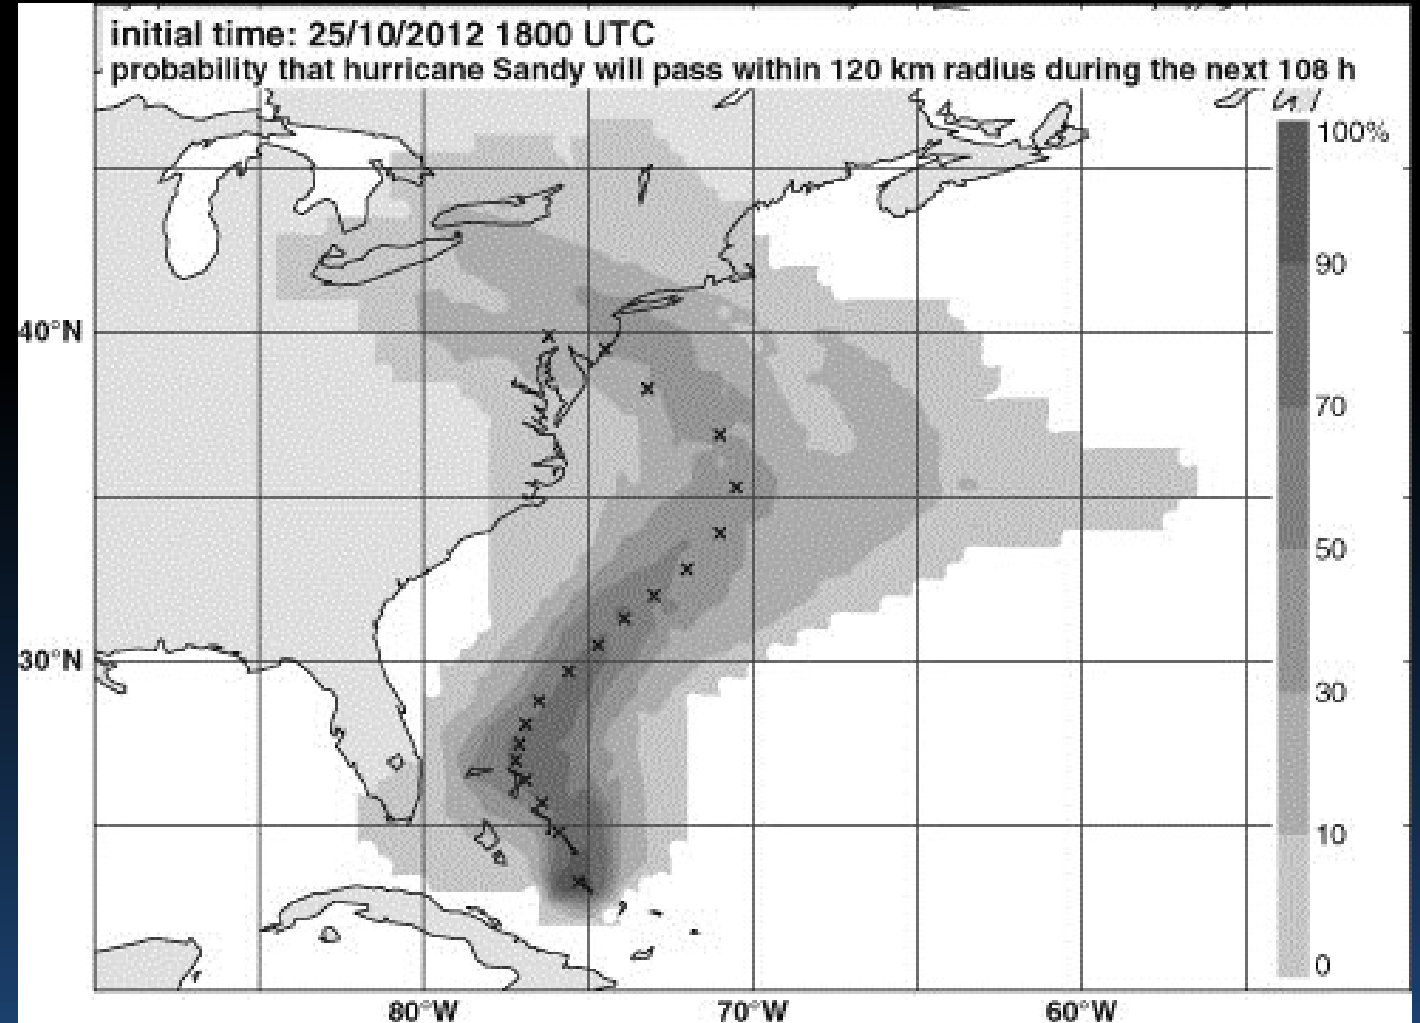

# Japan Meteorological Agency Ensemble Prediction System

- 27 members.
- Run at 00Z/12Z through 11 days.
- Resolution 0.375°.

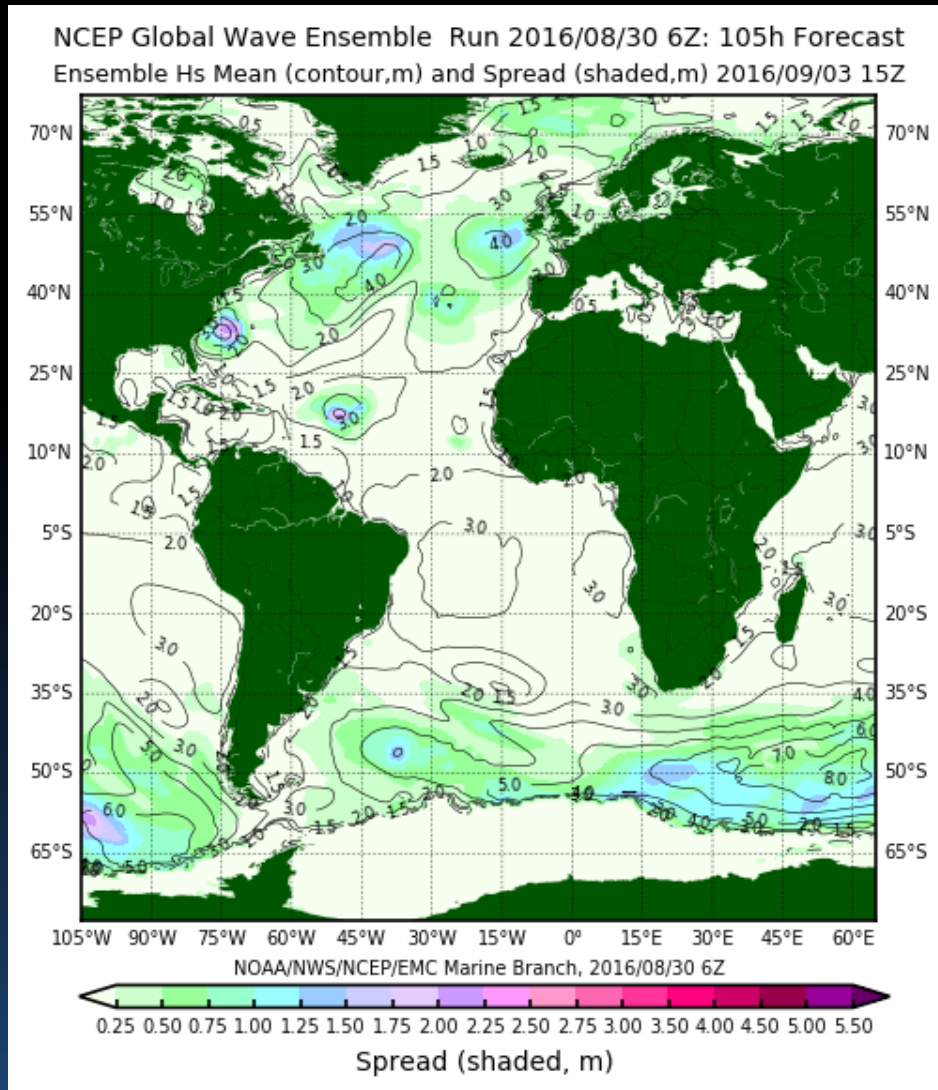

# Meteo-France Prevision d'Ensemble ARPEGE (PEARP)

- 35 members.
- Run twice a day through 4 ½ days.
- Resolution 10-60 km.

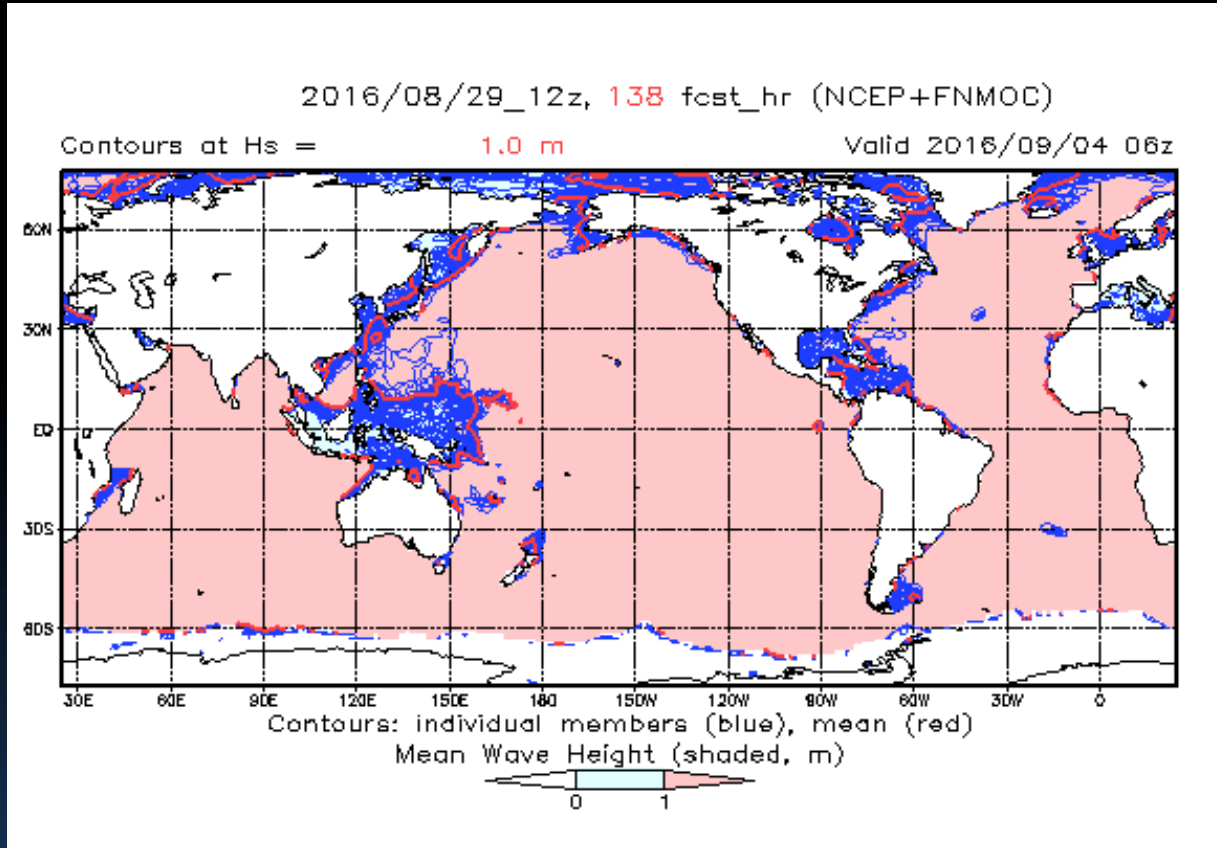

# Global Ensemble Ocean Wave Forecast System (GEOWaFS)

- Uses the winds from the 21 members of GEFS.
- WaveWatch III is the core model.
- Run 4 times a day through 10 days.
- $0.1^\circ \times 0.1^\circ$  resolution.

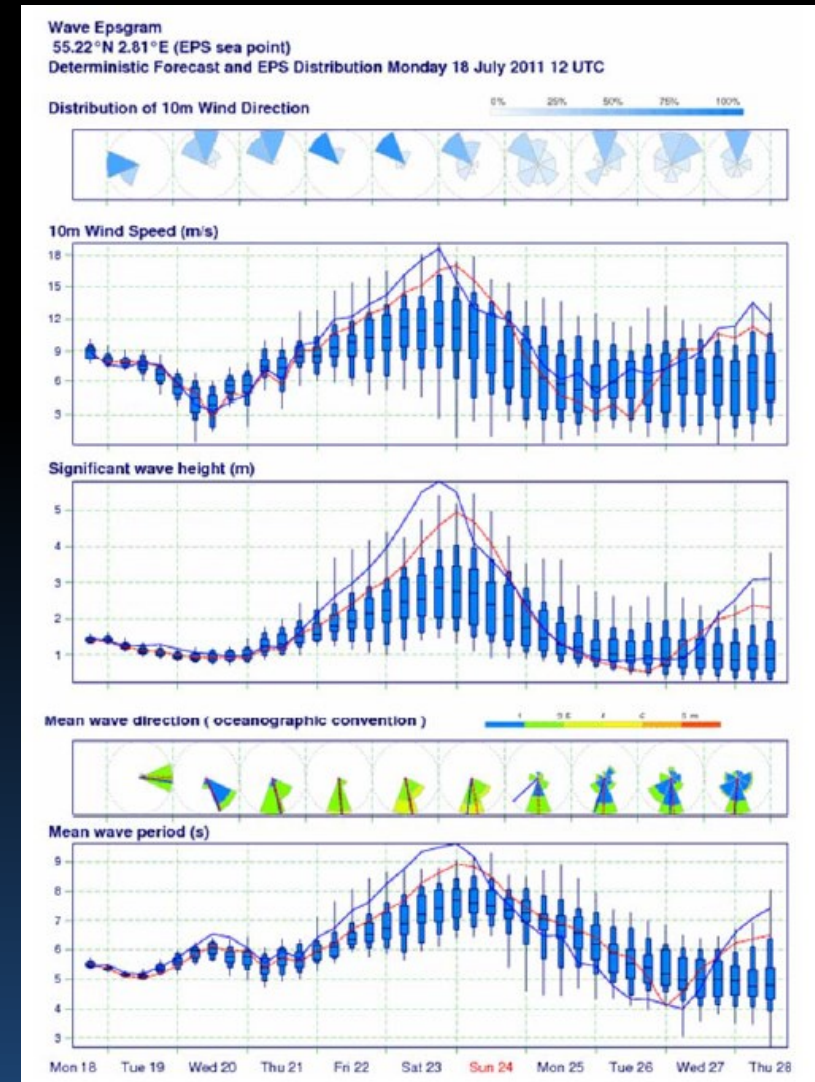

# NCEP/FNMOC Wave Ensembles (**NFCENS**)

- 41 total wave ensembles from GEFS and FNMOC.
- Run 4 times a day through 10 days.
- $0.1^\circ \times 0.1^\circ$  resolution.

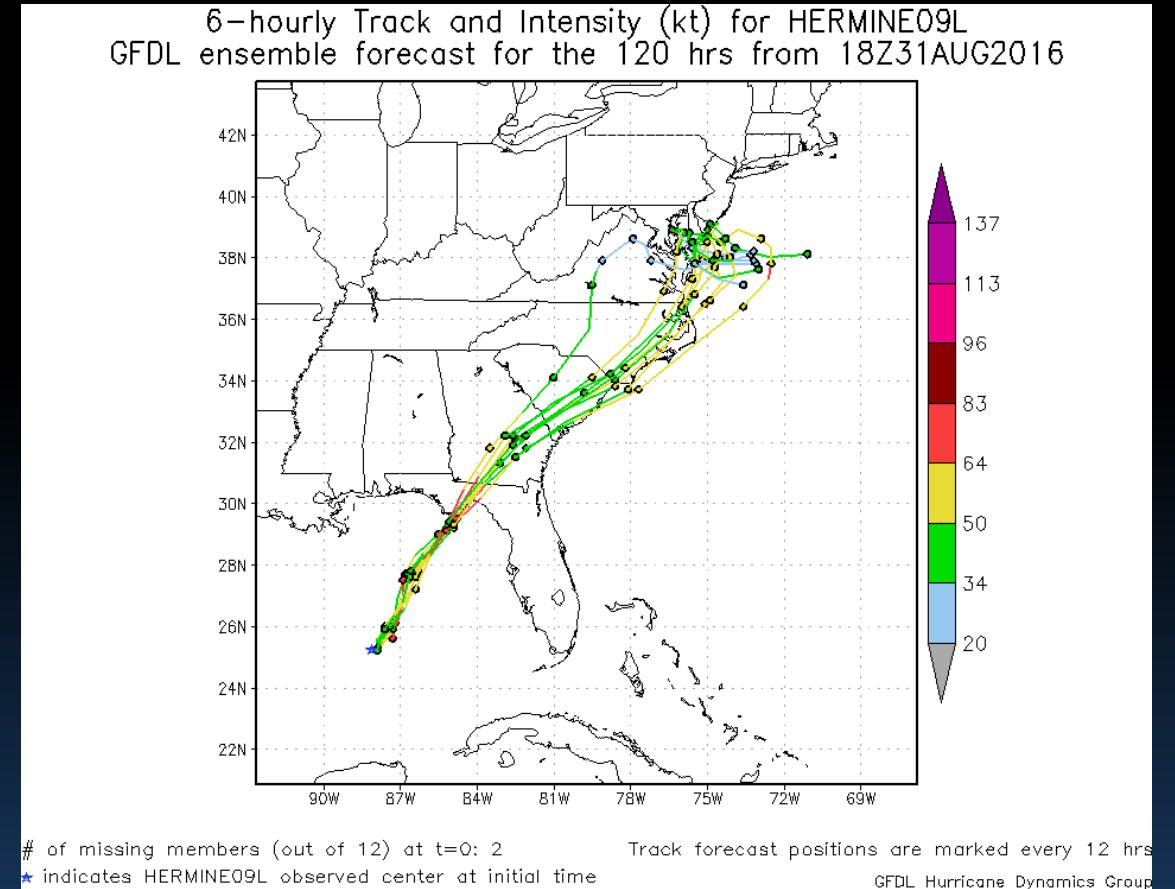

# ECMWF Wave Ensemble (ENS-WAM)

- 51 members.
- Run at 00Z/12Z through 15 days.
- $0.25^\circ \times 0.25^\circ$  resolution.

# GFDL Hurricane Model Ensemble

- GFDL model is the core.
- 12 members based on initial and boundary conditions from GFS.
- ~55 km (parent), ~18 km, and ~6 km nest resolutions.
- 42 vertical levels.

Short-Range EPS/EFS

# Short-Range Ensemble Forecast (**SREF**)

- 2 model cores used.
  - Nonhydrostatic Multiscale Model on B-grid (**NMM-B**)
  - Advanced Research WRF (**ARW**)
- 26 members produced from “perturbed” initial conditions & physics.
  - 13 members per core.
- Run at 03Z, 09Z, 15Z, and 21Z through 87 hours.
  - Hourly through 36 hours for derived aviation output (SREF website).
- Horizontal resolution 16 km.
- Vertical resolution 40 layers.

# Time-Lagged North American Rapid Refresh Ensemble (NARRE-TL)

- Composed of NAM and RAP models.
- 10 total members.
  - 6 RAP members
  - 4 NAM members
- Run hourly out to 12 hours.
- ~12 km resolution.
- Time-lagging.
  - Use prior forecasts valid at same time.
  - Greatest weight on most recent forecast.

# NARRE-TL Output

## Prob of Cloud Base < 1k ft

NARRE-TL: Probability of Ceiling (AGL) < 1000 feet 01H FCST

# NARRE-TL Output

## Prob of QPF > 0.5"

## Prob of Wind Gust > 20 kt

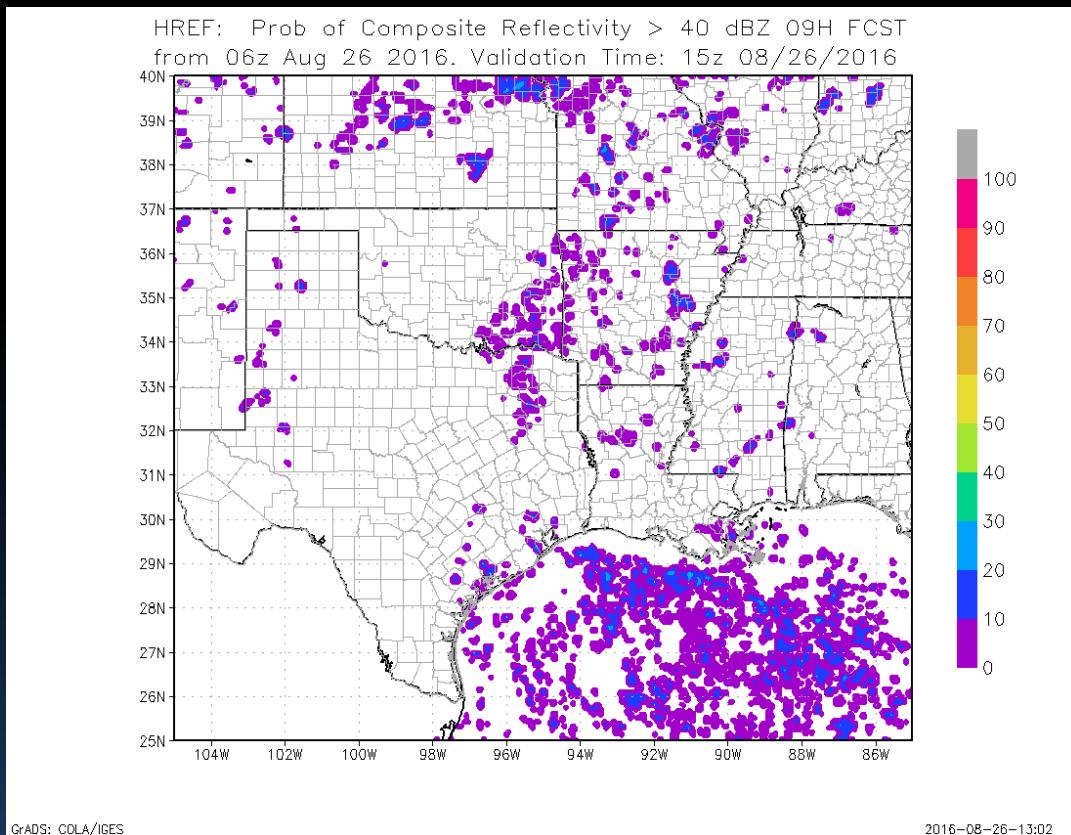

# Time-lagged High Resolution Ensemble Forecast (HREF)

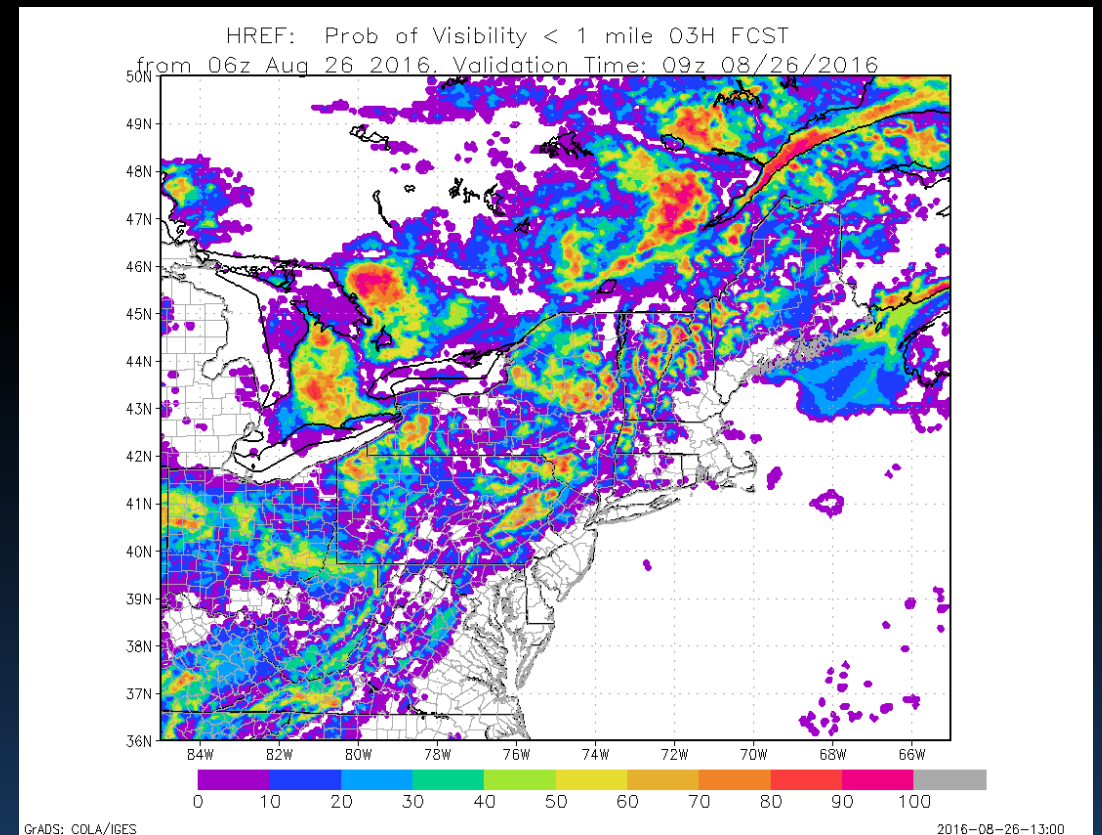

- HiResW-ARW, HiResW-NMMB, NAM-NEST models.
- 9-11 members.
- Run every 6 hours through 36 hours.
- ~4 km resolution.

# HREF Output

## Prob of Composite Reflectivity > 40 dBZ

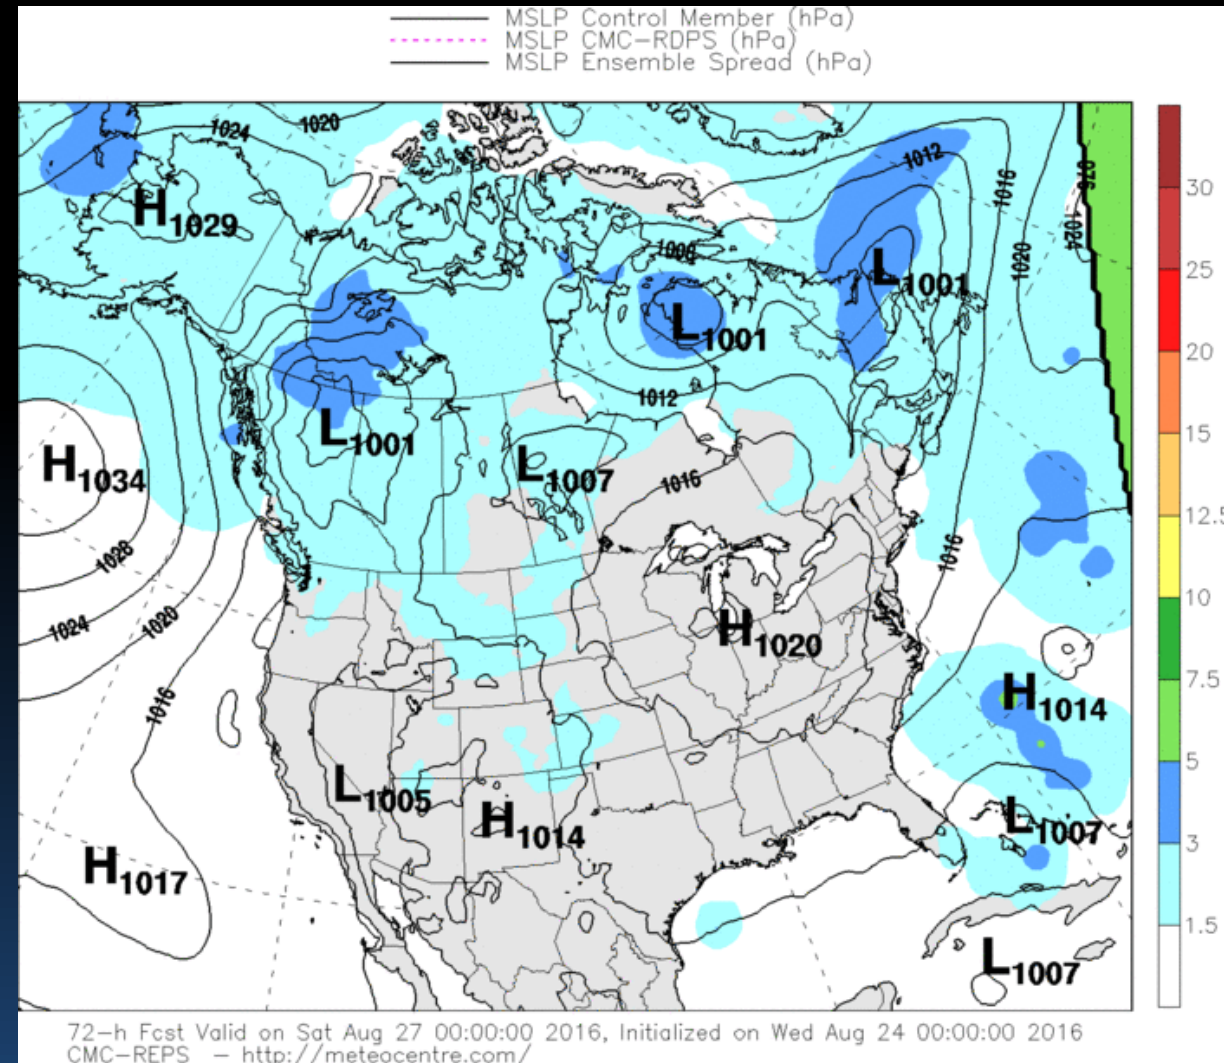

## Prob of Visibility < 1 mile

# CMC Regional Ensemble Prediction System (**REPS**)

- Initial conditions from GEPS.
- Physics “perturbations” result in 20 members.
  - 1 unperturbed control run.
- Run at 00Z/12Z through 72 hours.
- ~15 km horizontal resolution.
- 48 vertical levels.

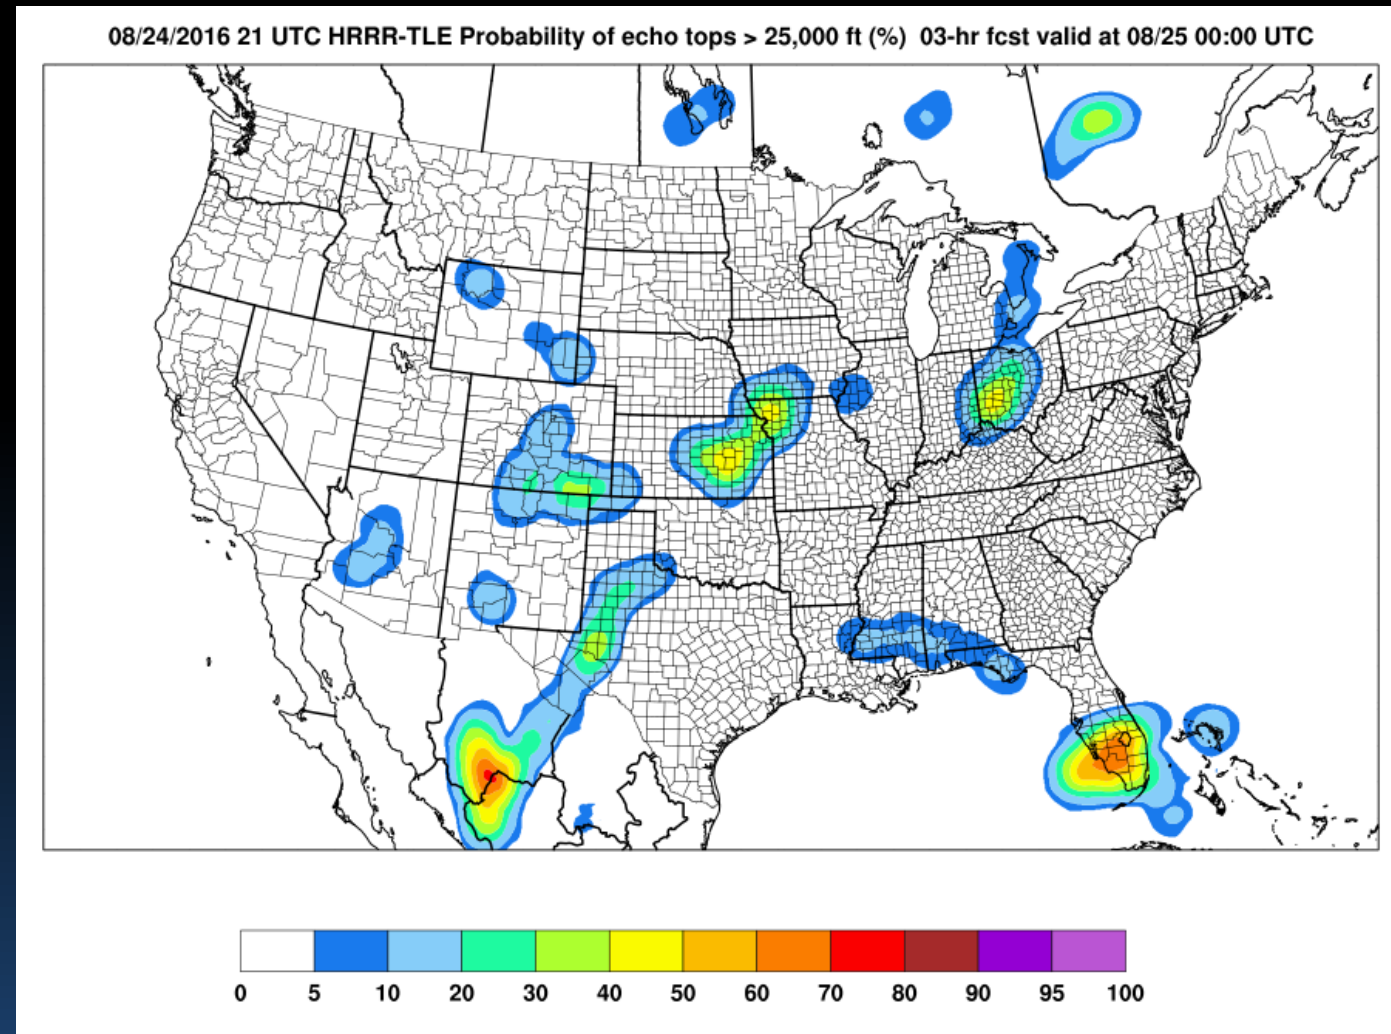

Storm Scale EPS/EFS

# HRRR Time-Lagged Ensemble (**HRRR-TLE**)

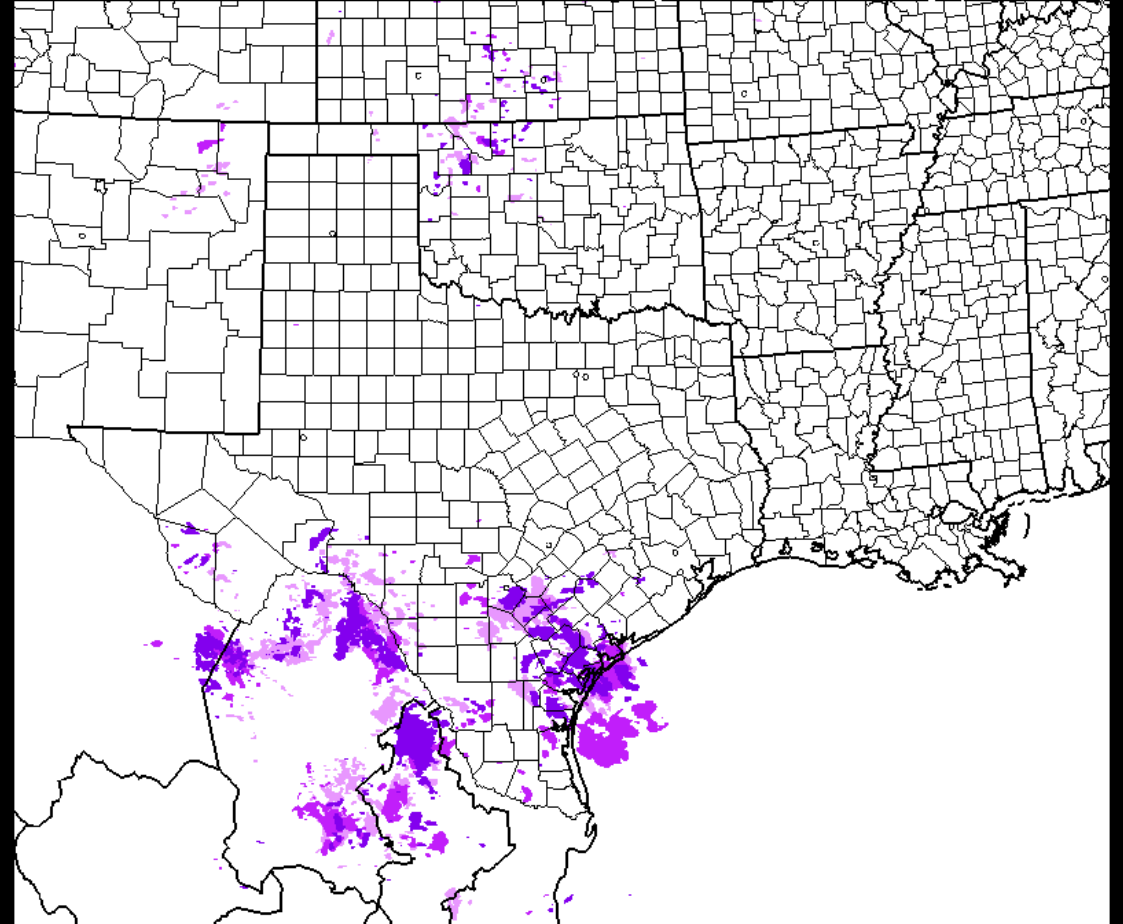

- Experimental.
- 3 members.
  - Most recent HRRR run.
  - 2 previous HRRR runs.
- Run through 24 hours.
- 3 km resolution.
- Neighborhood probabilities.
- Severe wx, flash flood, and aviation applications.

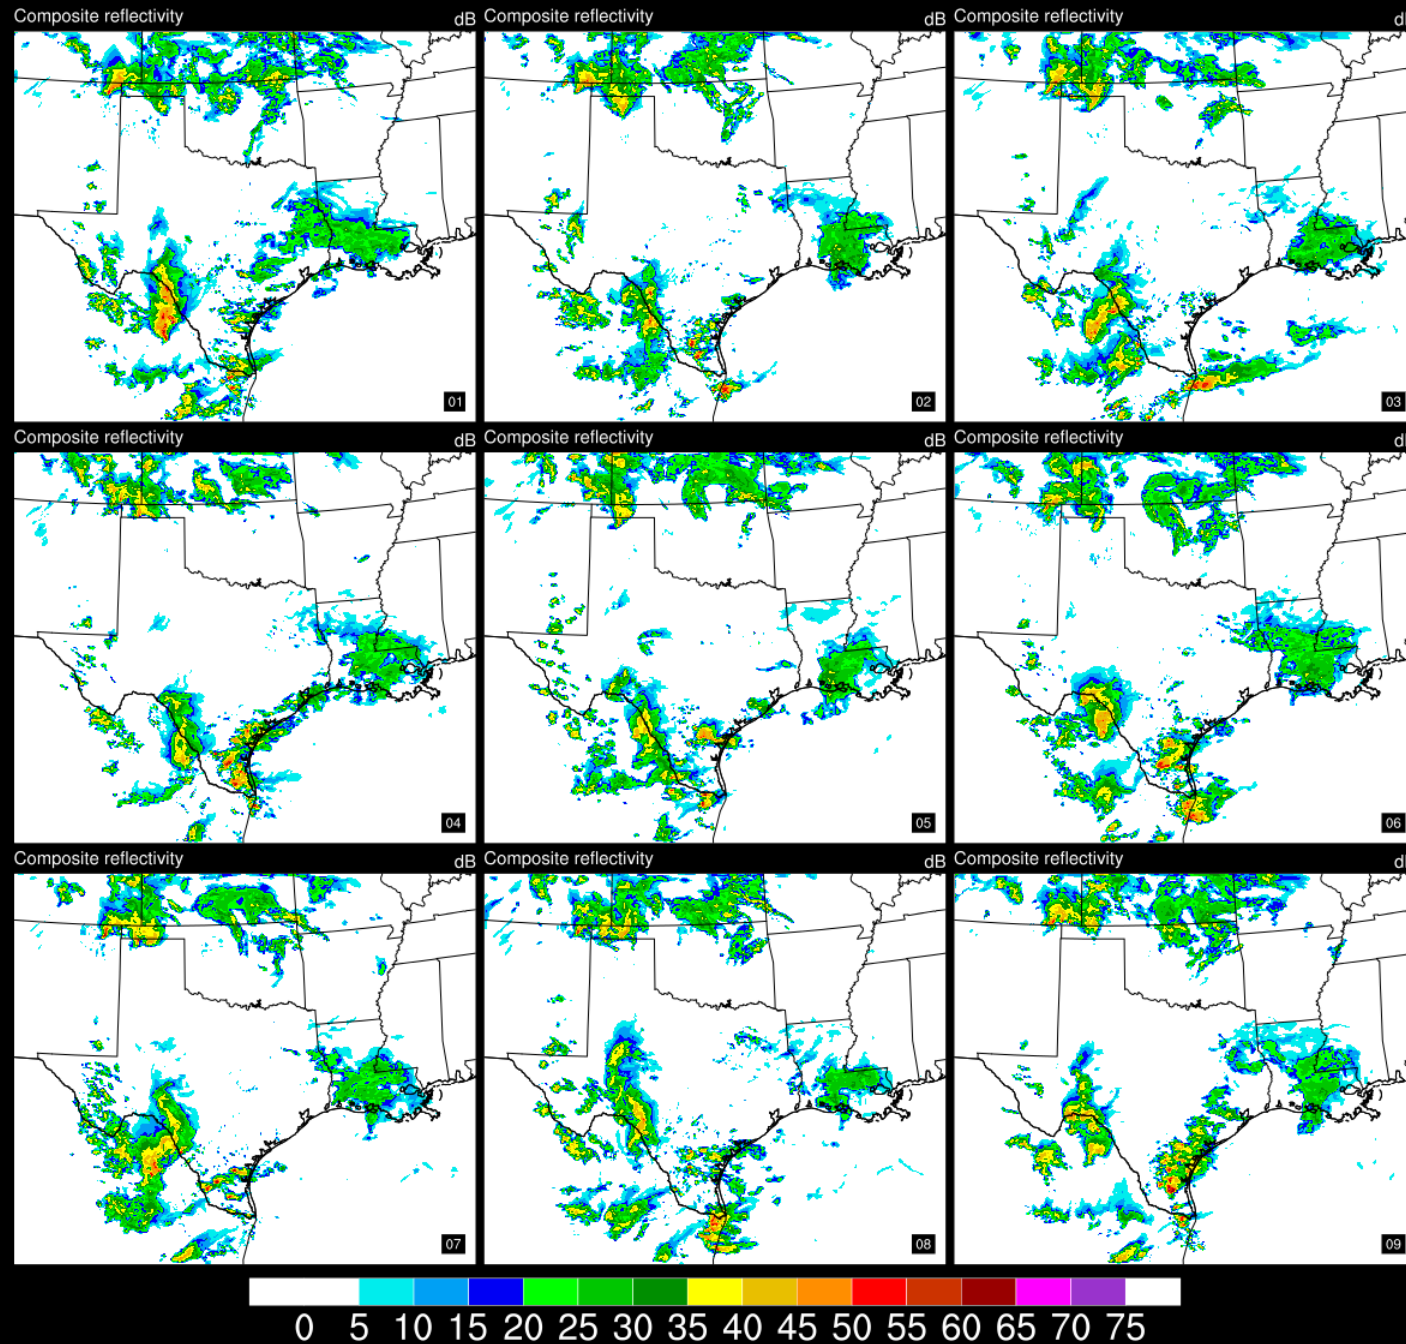

# HRRR Ensemble (**HRRRE**)

- Experimental.
- 3-18 members.
  - Uses 40 HRRR members for data assimilation.
- 3 km resolution.
- Smaller domain than HRRR.
- Perturbations from GEFS.

HRRRE 05/16/2016 (00:00) 6h fcst - Experimental  
9-member Ens Composite Reflectivity (>40 dBZ)

# HRRRE 05/15/2016 (18:00) 12h fcst - Experimental Valid 05/16/2016 06:00 UTC

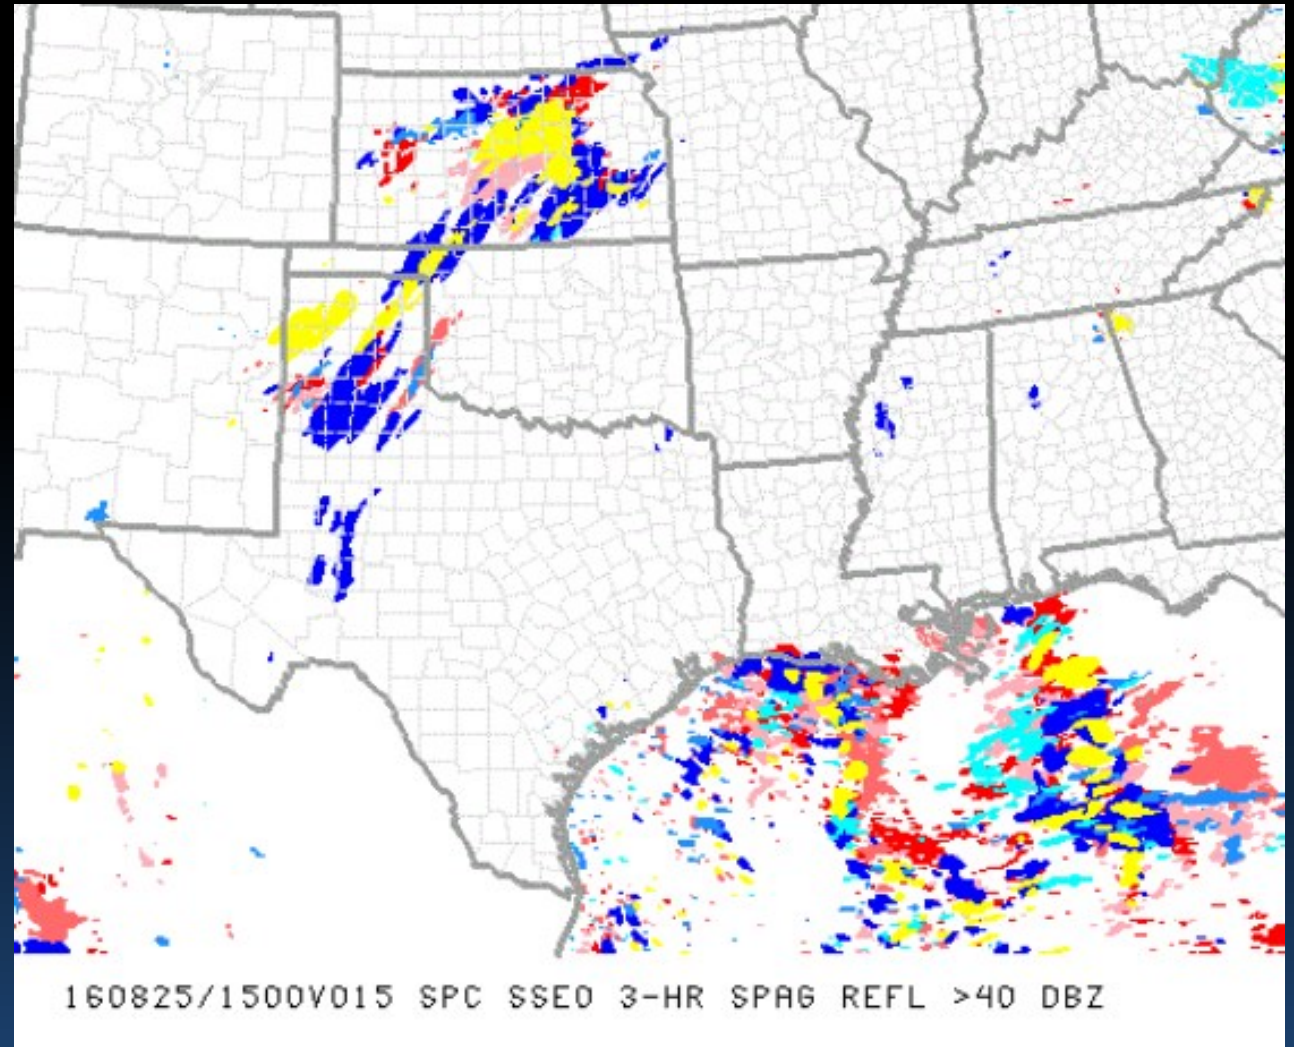

# SPC's Storm-Scale Ensemble of Opportunity (**SSEO**)

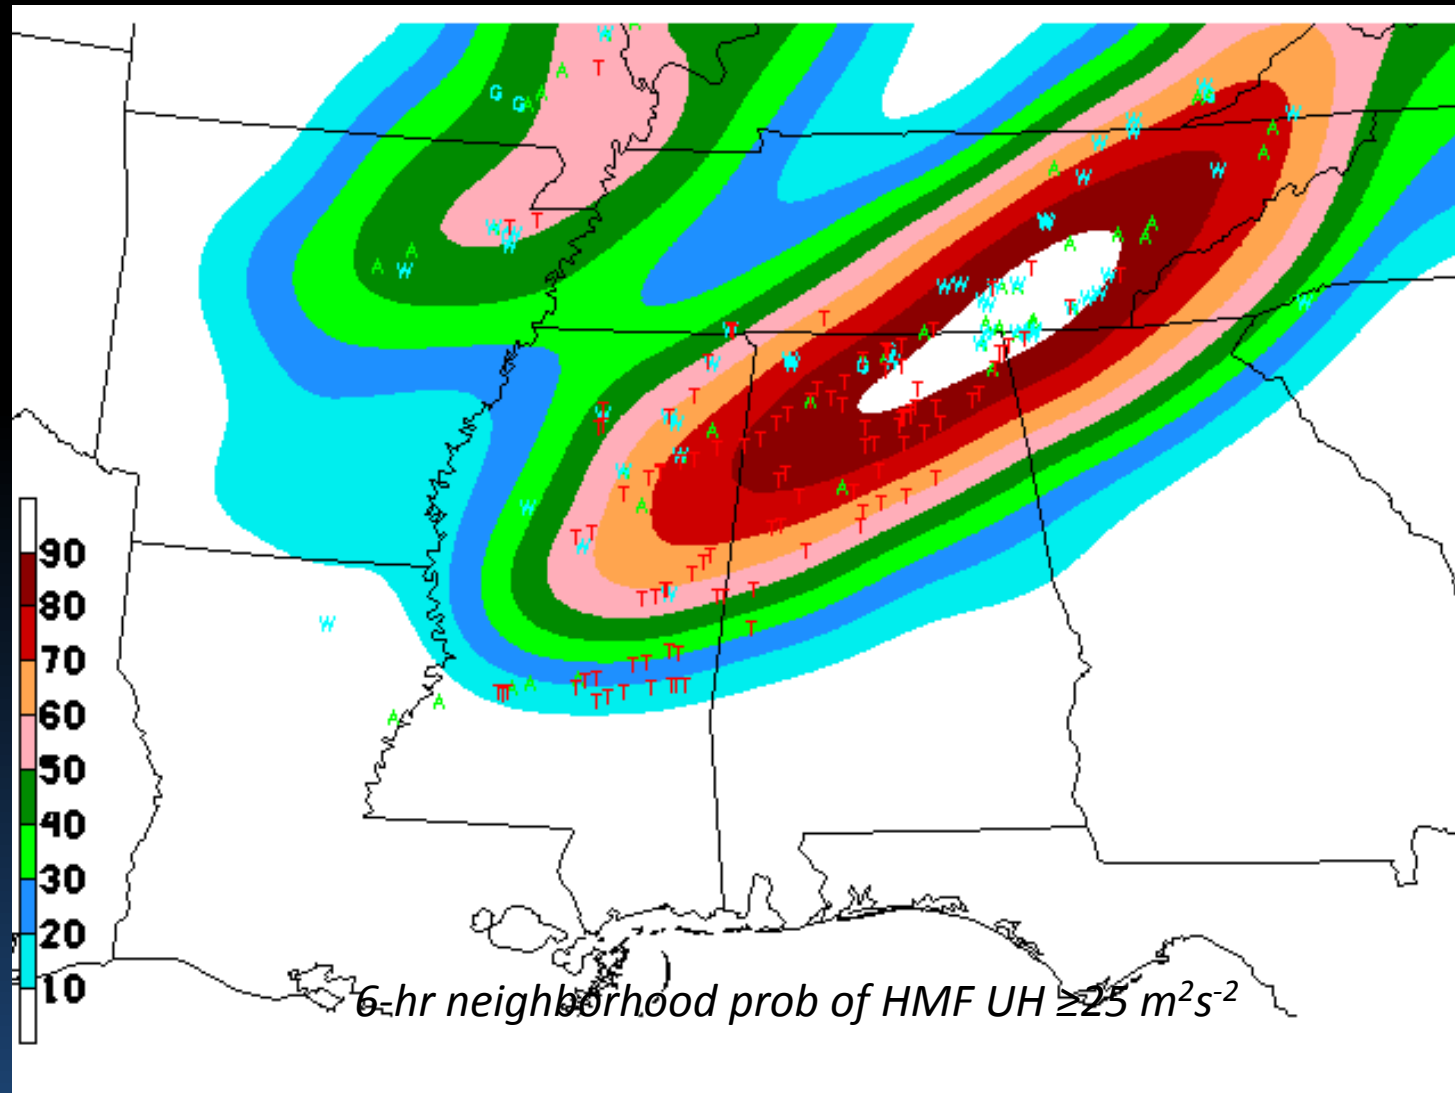

- 1) **NSSL ARW**
- 2) **HRW ARW**
- 3) **HRW ARW -12 h**
- 4) **CONUS WRF-NMM**
- 5) **HRW NMMB**
- 6) **HRW NMMB -12 h**
- 7) **NAM CONUS Nest**

- Processed in N-AWIPS and GEMPAK by SPC.
- Run at 00Z/12Z thru 36 hours.
- ~4 km resolution.

# Storm Scale Ensemble Forecast (**SSEF**)

## 3DVAR-based

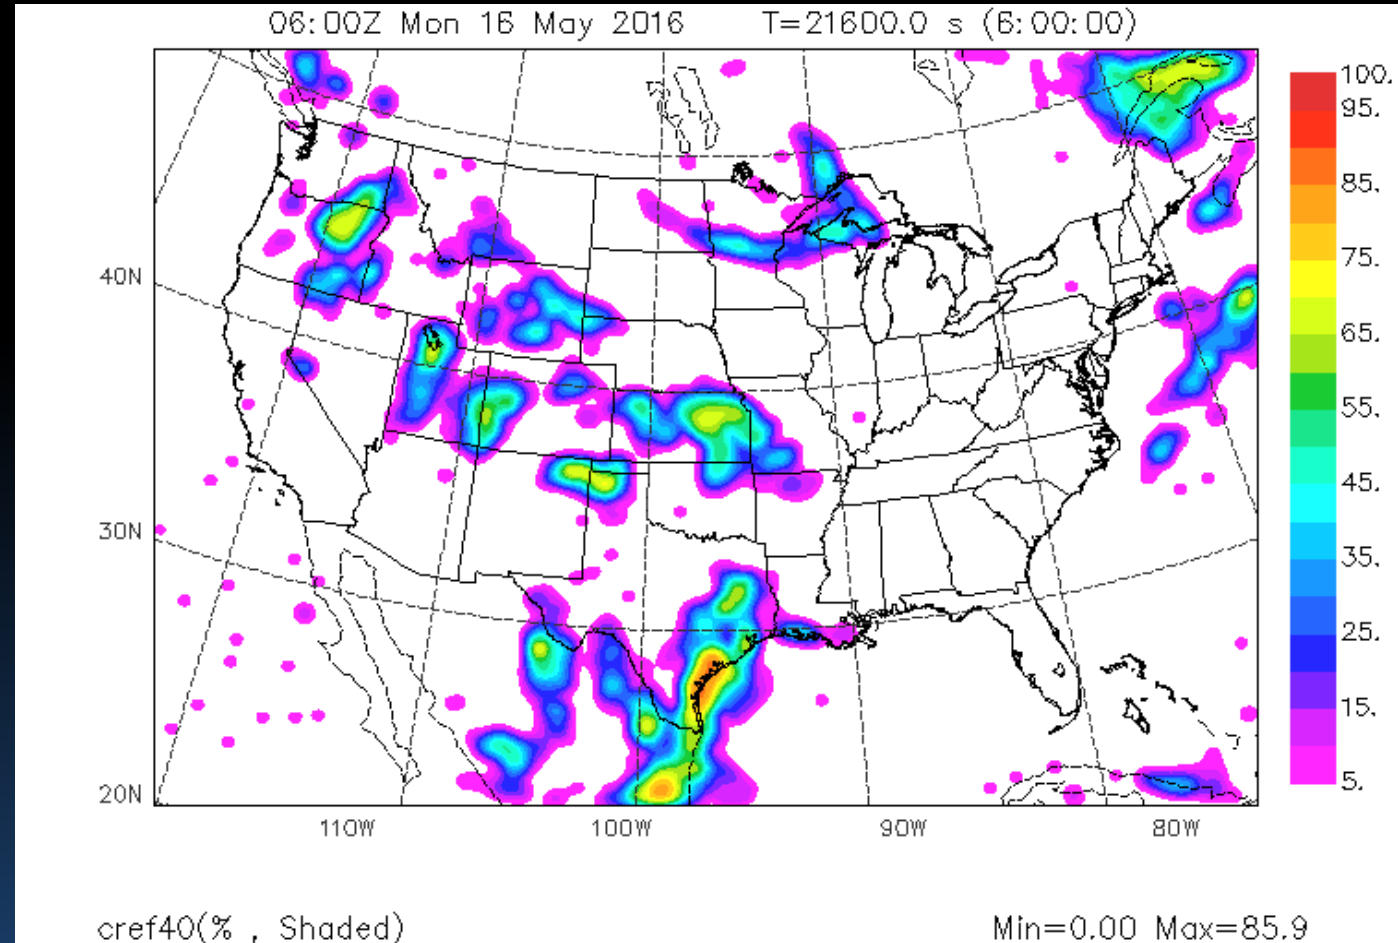

- 19 WRF-ARW & 6 NMM-B members.
- Run at 00Z through 60 hours.
- 3 km resolution.
- Available only in the Spring.

# Storm Scale Ensemble Forecast (**SSEF**)

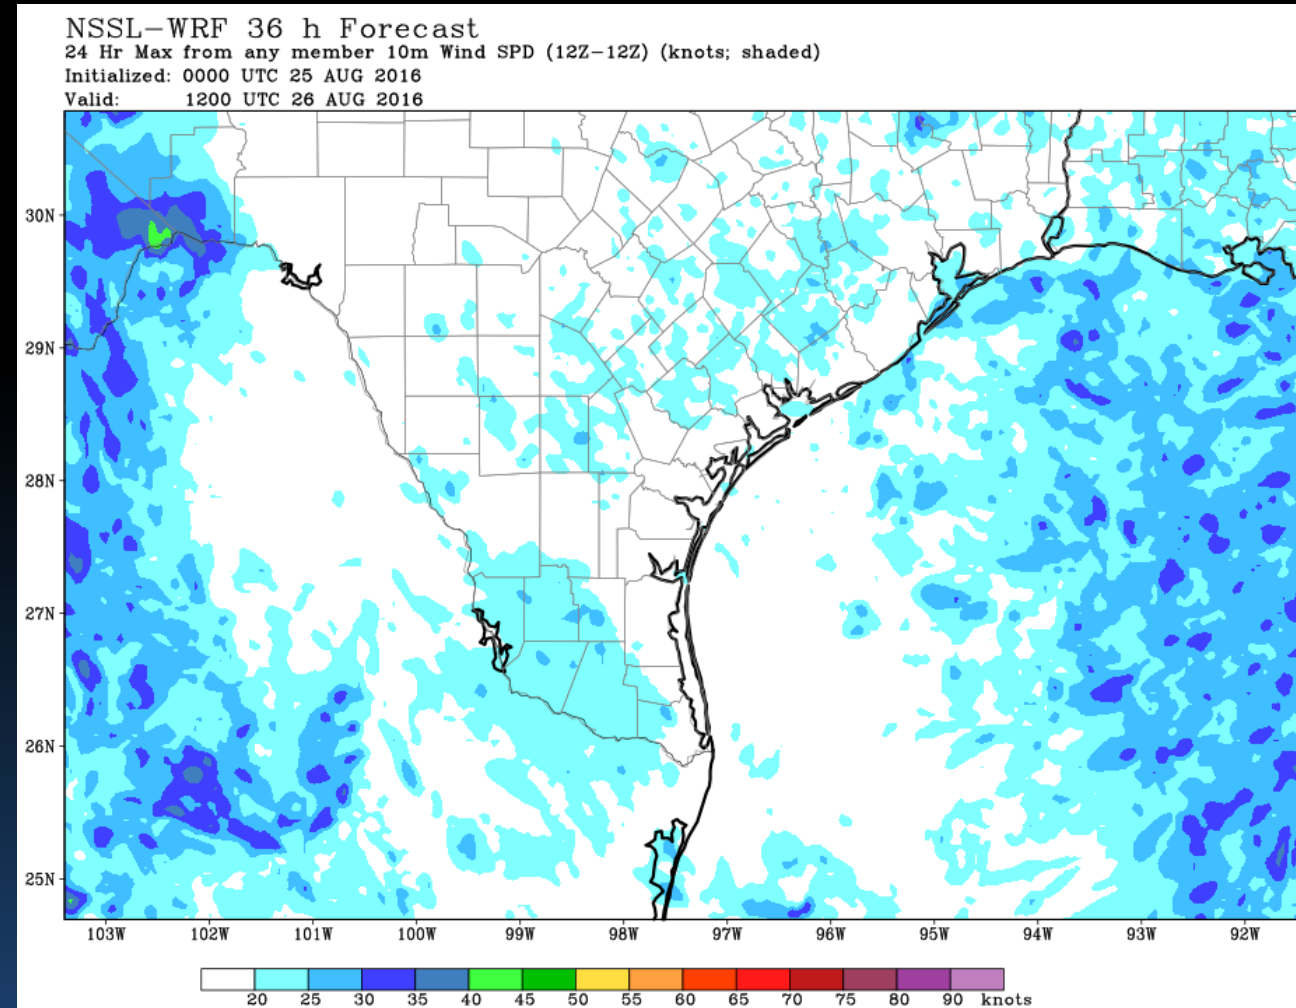

## GSI+EnKF-based

- 40 input members.
- 12 forecast members.
- Run at 00Z through 60 hours.
- 3 km resolution.
- Available only in the Spring.

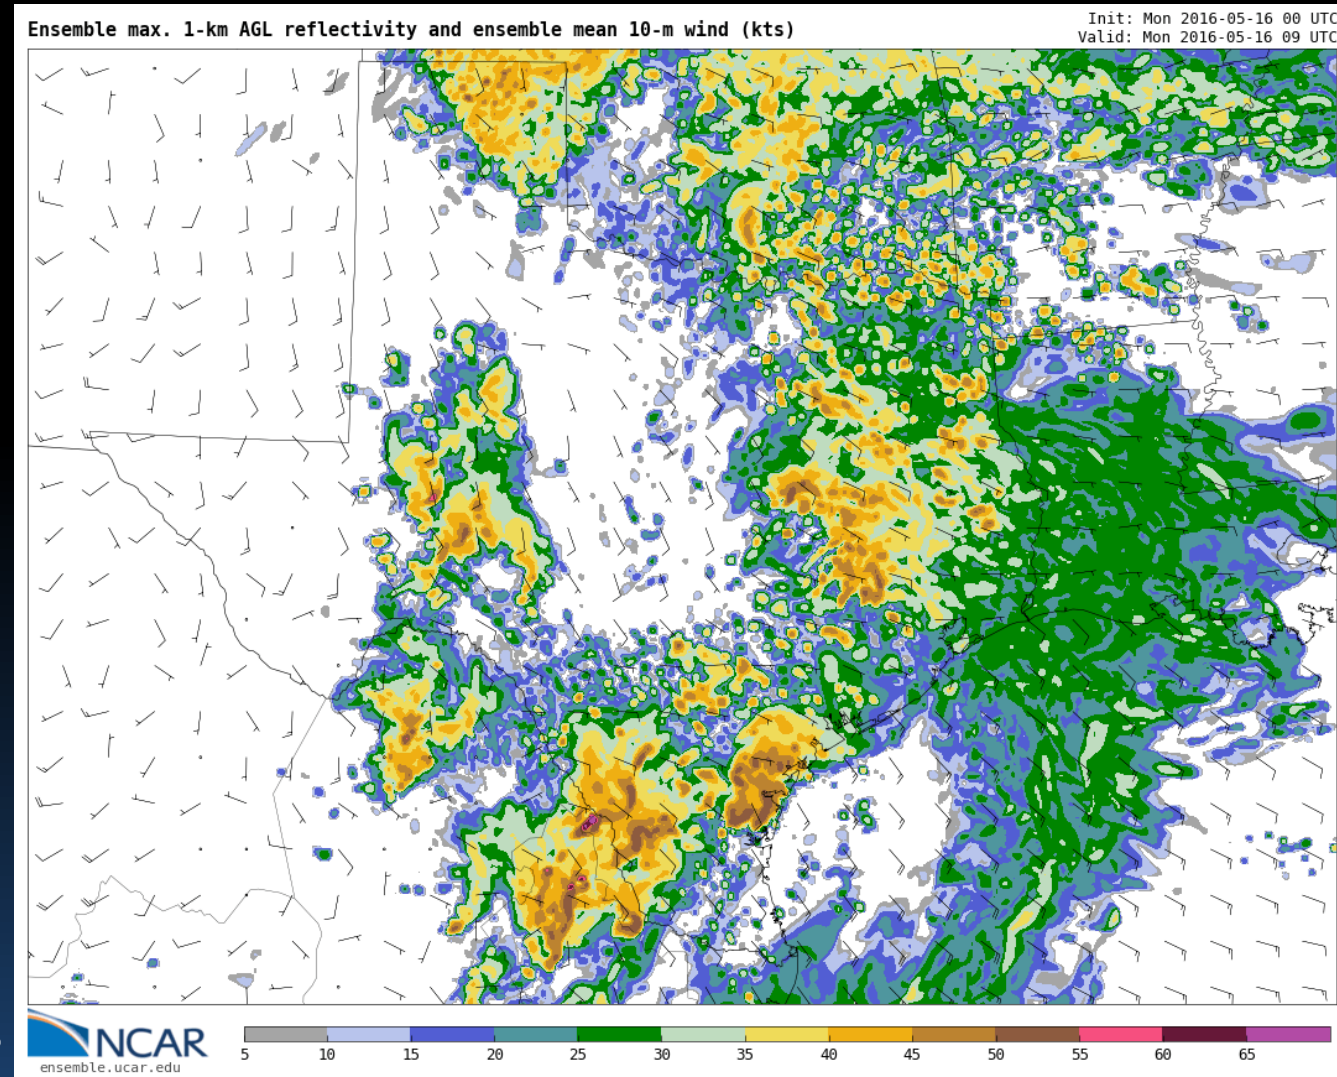

# NSSL WRF Ensemble

- 9 members.
  - NSSL WRF
  - SREF members
- Run at 00Z through 36 hours.
- 4 km resolution.
- Severe Wx/Flood applications.

# NCAR Ensemble

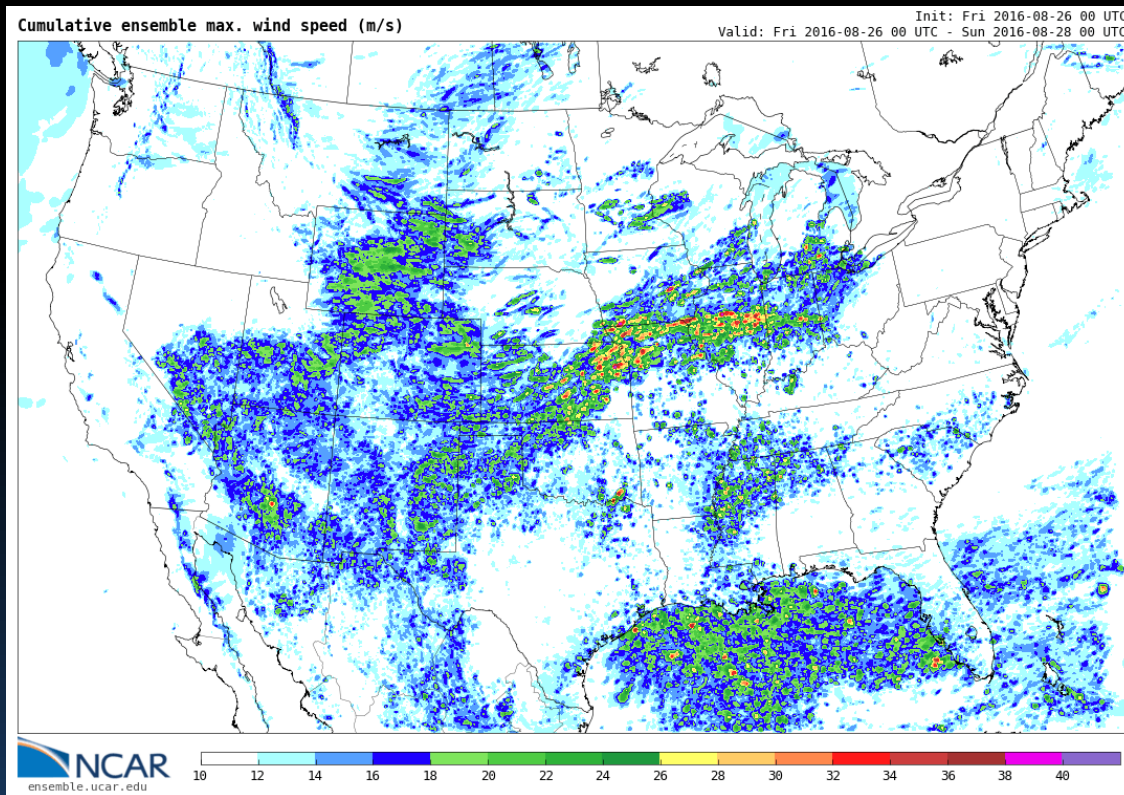

- WRF-ARW.
- Run at 00Z through 48 hours.
- 10 members.
- 3 km resolution.
- Severe/Winter WX applications.

# NCAR Ensemble Output

## Cumulative Ensemble Max Wind Speed

## Ensemble Mean MLCAPE/0-6 km Shear

# Anomalies

# Can an EPS tell us something about the historical significance of a weather event?

- Not really.
- An EPS does not place the forecast into historical context.
- “How does the current forecast compare to typical conditions at this time of year?”
- “How does the current forecast compare to past forecasts?”

# Basic Climate Concepts

- **R-Climate**

- Reanalysis or observed data-based climatology.
- CFSR, ERA-Interim, MERRA-2, NARR, etc.

- **M-Climate**

- Internal model or forecast system climatology.

# Placing the Forecast in Context

- **R-Climate**

- “You don’t usually get a surface low pressure that strong across the Northwest Gulf of Mexico in April.”

- **M-Climate**

- “The GEFS rarely predicts this much precipitation, 5 days out.”

# R-Climate

- Significant high-impact events **DO** have a strong signal!
- High DSS value.
  - Allows partners to make decisions in advance of an extreme event!
- Does **NOT** say anything about impacts!
  - Inferred?
  - Analogs will somewhat address impacts.

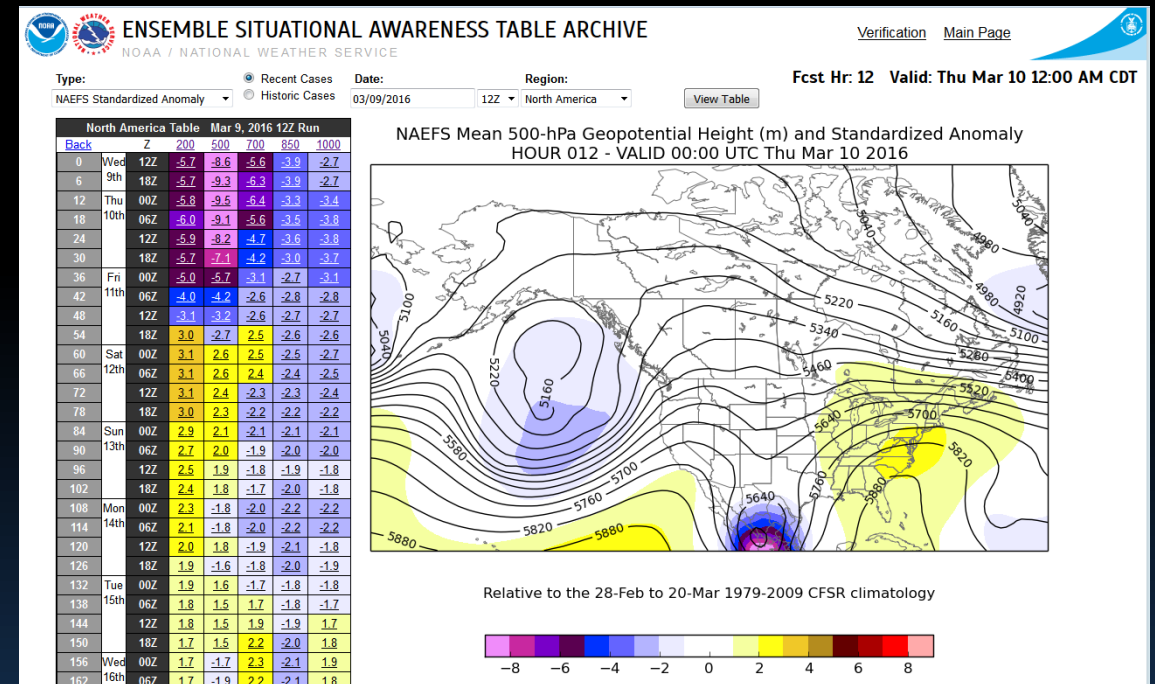

# R-Climate Statistics

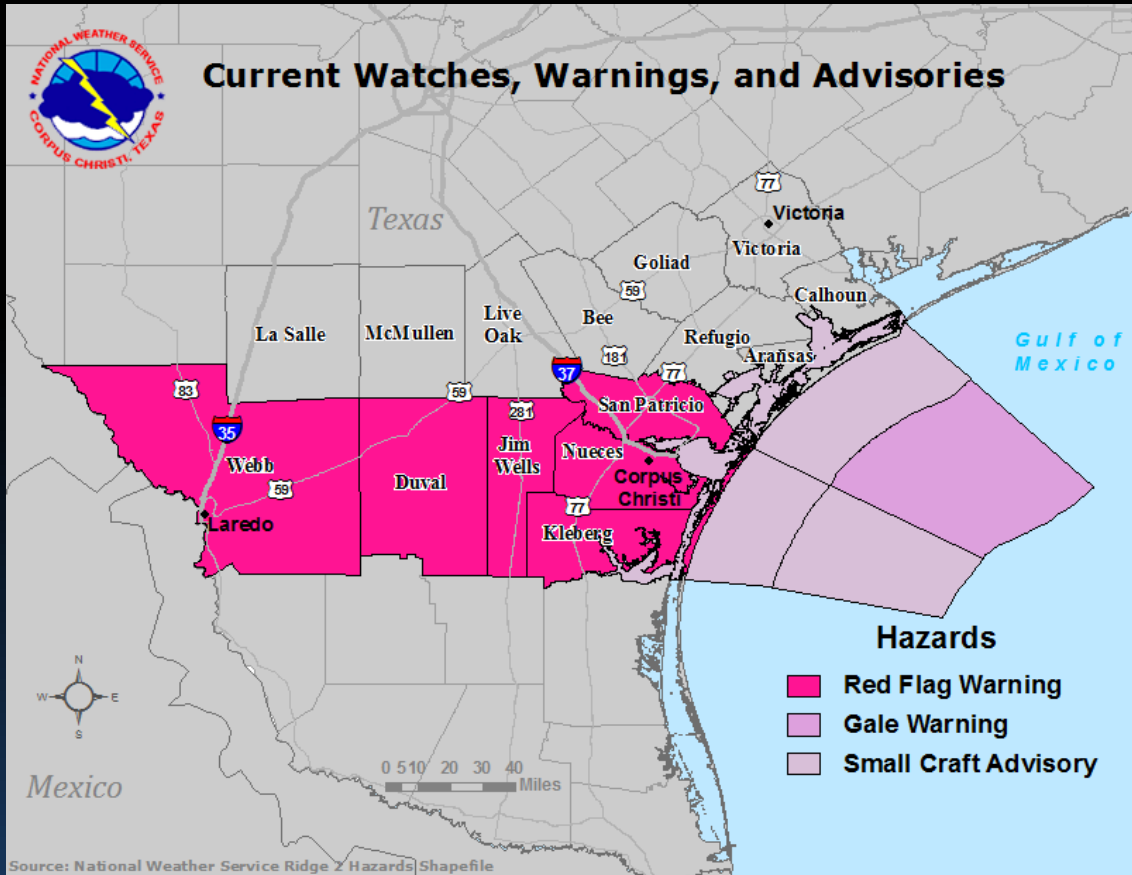

- **Standardized or normalized anomaly**
  - $(\text{Forecast} - \text{Climate Mean}) / \text{Climate Standard Deviation}$
  - Dispersion “issues” are usually solved.
  - Compare “apples to apples”.
- **Percentile**
  - “Where would the forecast fall with respect to climatology?”
- **Return Interval**
  - “How often do these forecast values show up in the climatology?”
- **Probabilities**
  - “How many members produce extreme values?”

# WRH Situational Awareness Table

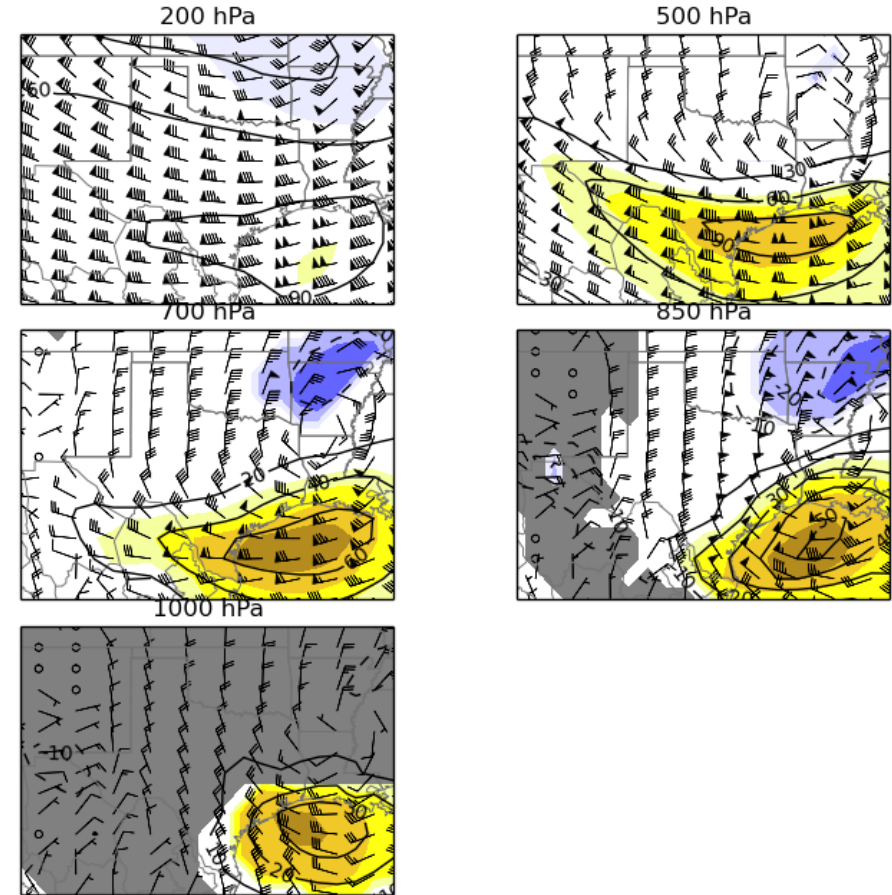

- Use R-Climate to quickly identify where/when the forecast departs from climatology.
- Compares the NAEFS ensemble mean and CFSR (1979-2009).
- Strong “signal” implies most members depart from climo.
  - Extreme event detection likely.

# M-Climate

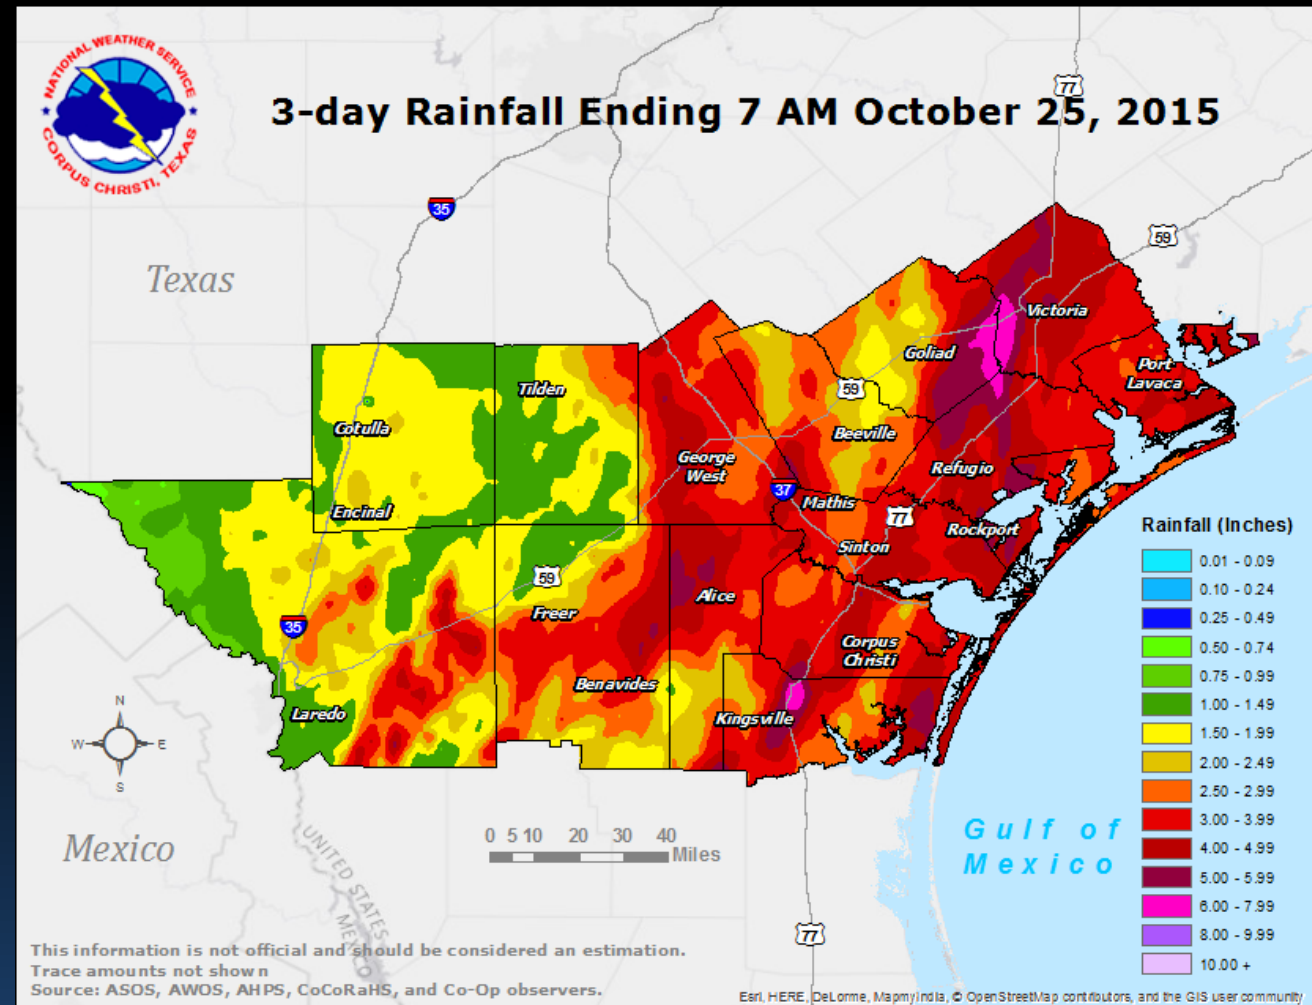

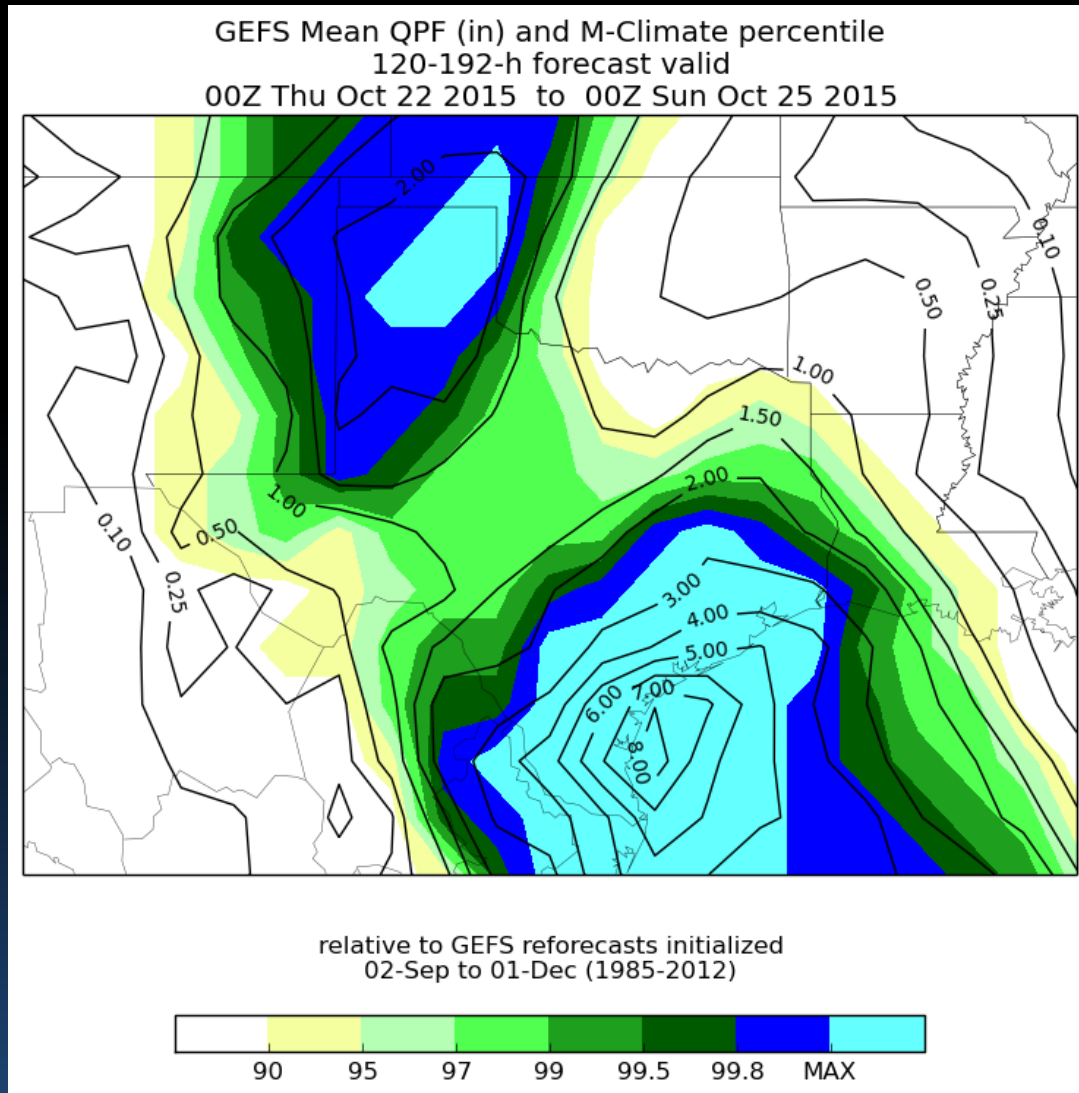

- How does the current forecast compare to past forecasts?
- Past forecast climatology is called a “reforecast”.
  - Time-consuming to produce.
- GEFS reforecasts go back 30 years.
  - Analyzed with reanalysis data (CFSR).

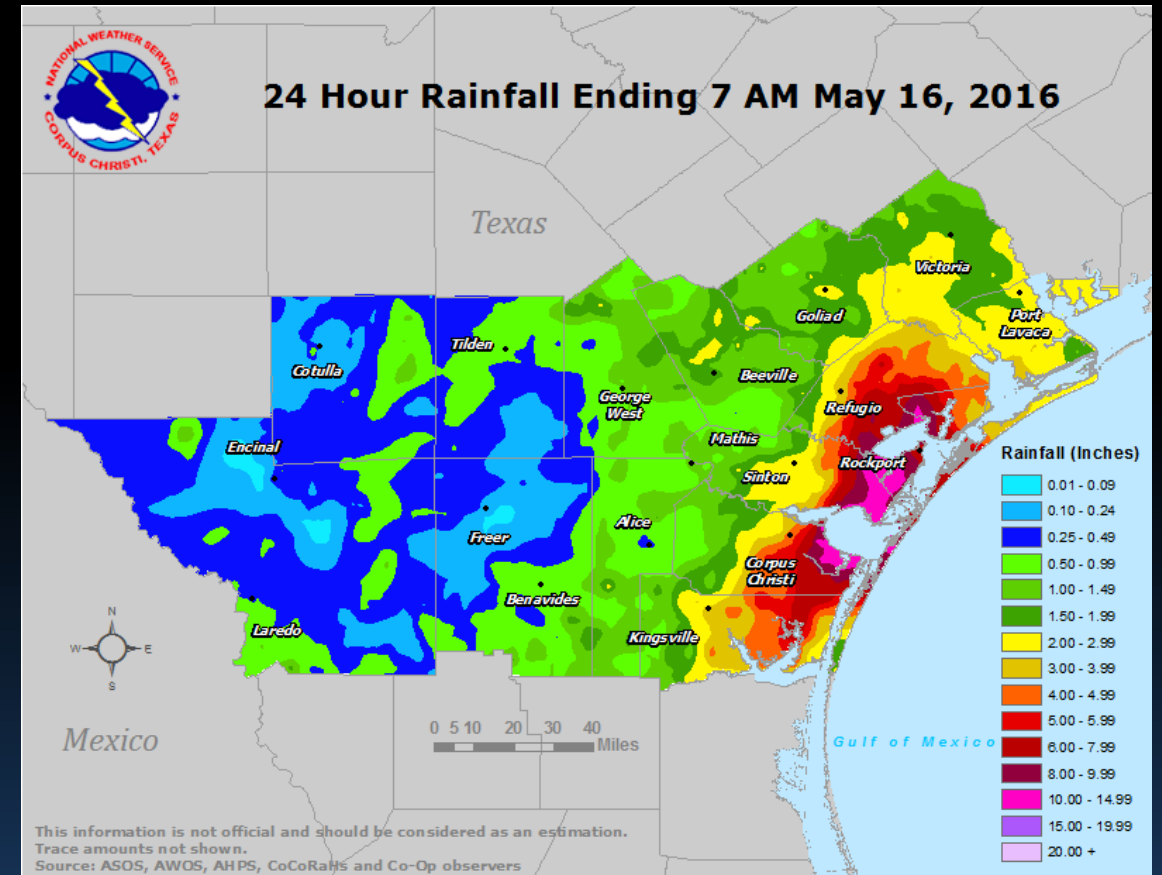

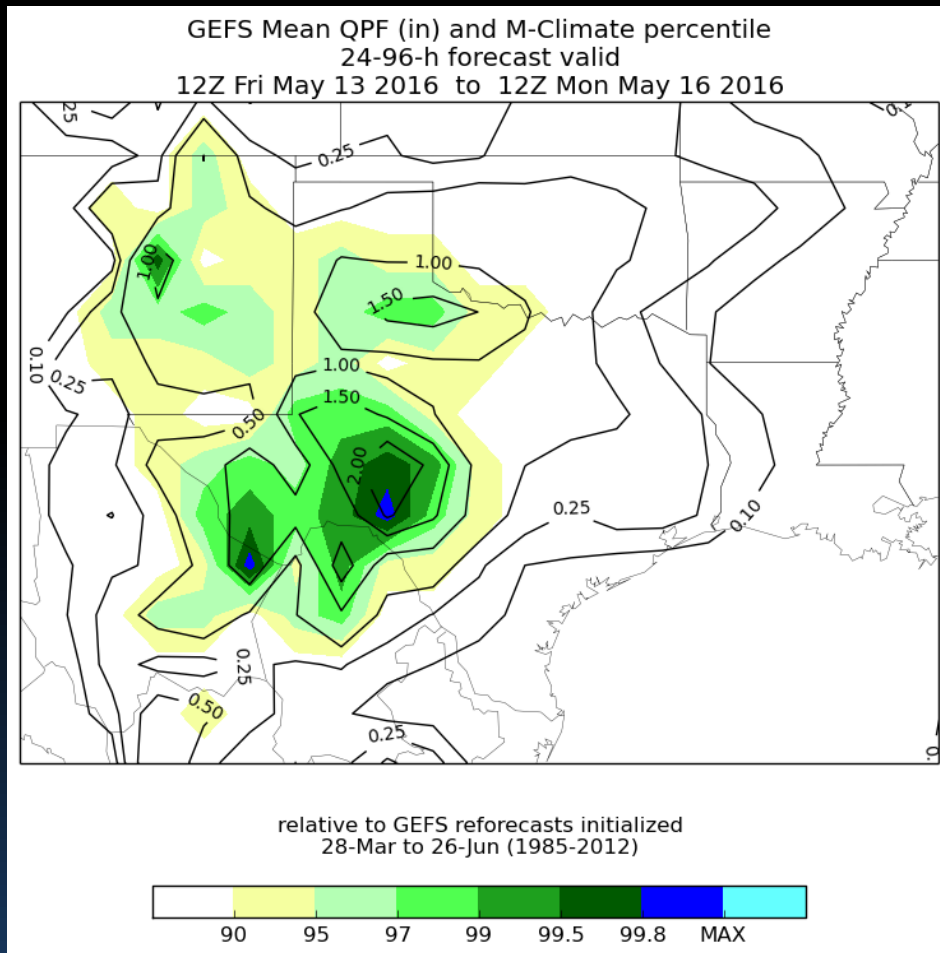

# GEFS Mean QPF M-Climate Percentile

## Oct 22-25, 2015

# Anomalies can still miss significant events

# Extreme Forecast Index (EFI)

- Index used to identify an extreme event based on the M-Climate.

000-072hr fcst from 00Z Tue Aug 30. Valid 00Z Tue Aug 30 - 00Z Fri Sep 02

Based on 2nd-Generation GEFS Reforecast.

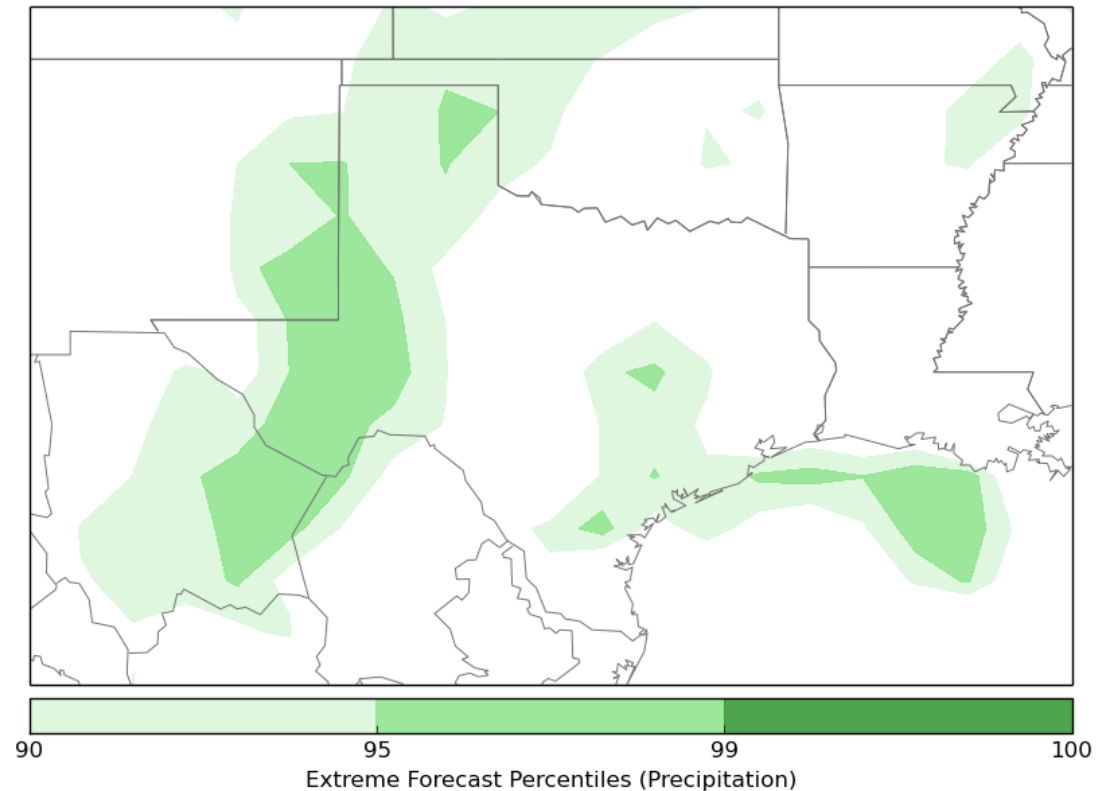

Extreme Percentiles: Accumulated Precipitation, 2m Temperature, 10m Wind

NOAA/ESRL Physical Sciences Division

000-024hr fcst from 00Z Mon Aug 29. Valid 00Z Mon Aug 29 - 00Z Tue Aug 30

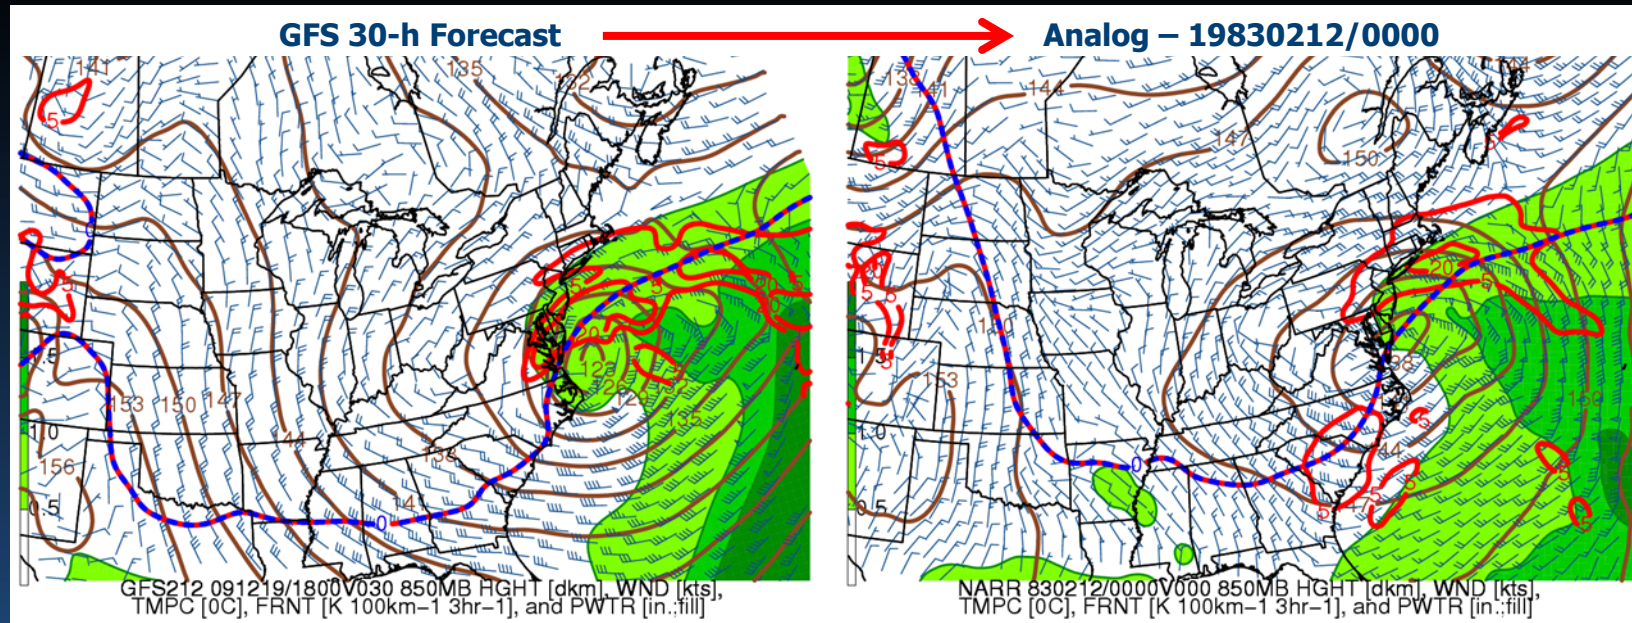

Based on 2nd-Generation GEFS Reforecasts

Analogs

# What is an Analog?

- If the current state of the atmosphere resembles a previous state then the two are termed **analog**s.
- “Pattern recognition”.

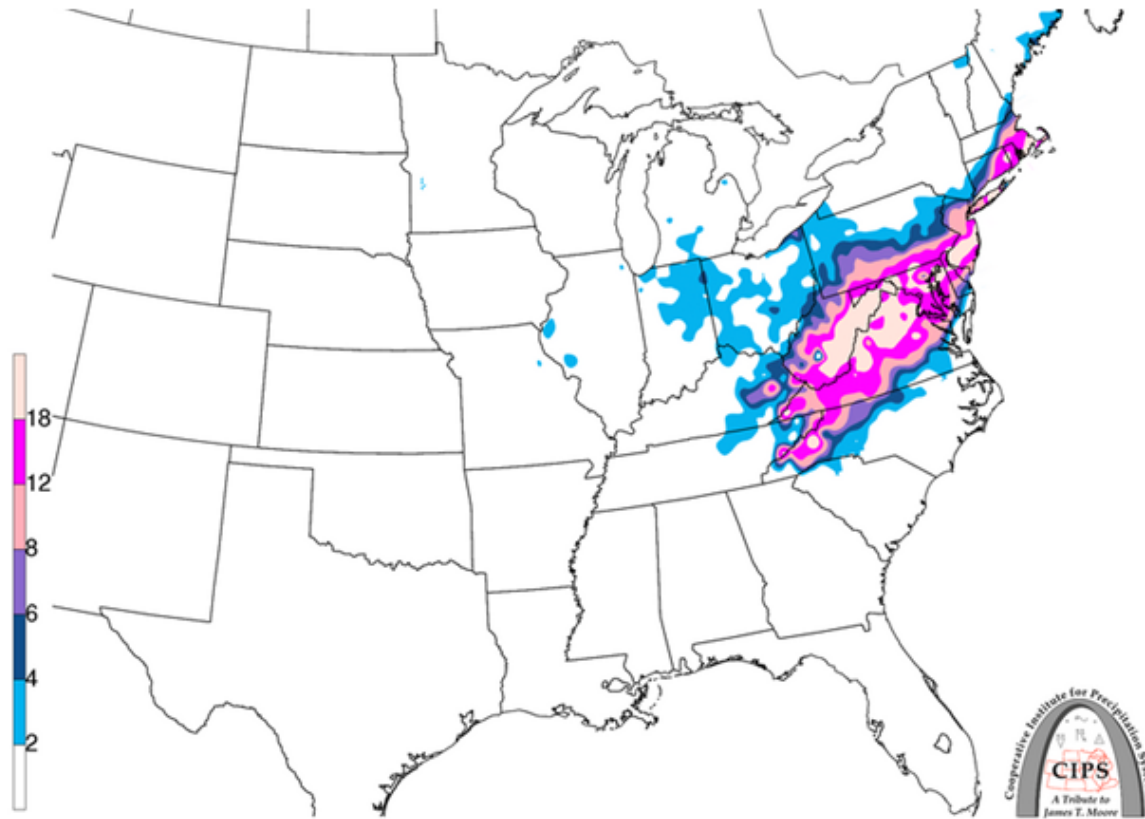

# Benefits of Analogs

- Assists forecasters in identifying high impact events.
  - “Anomalous” events.
- Awareness of potential impacts.
  - Similar past analogs may produce similar impacts.
- Increases situational awareness.

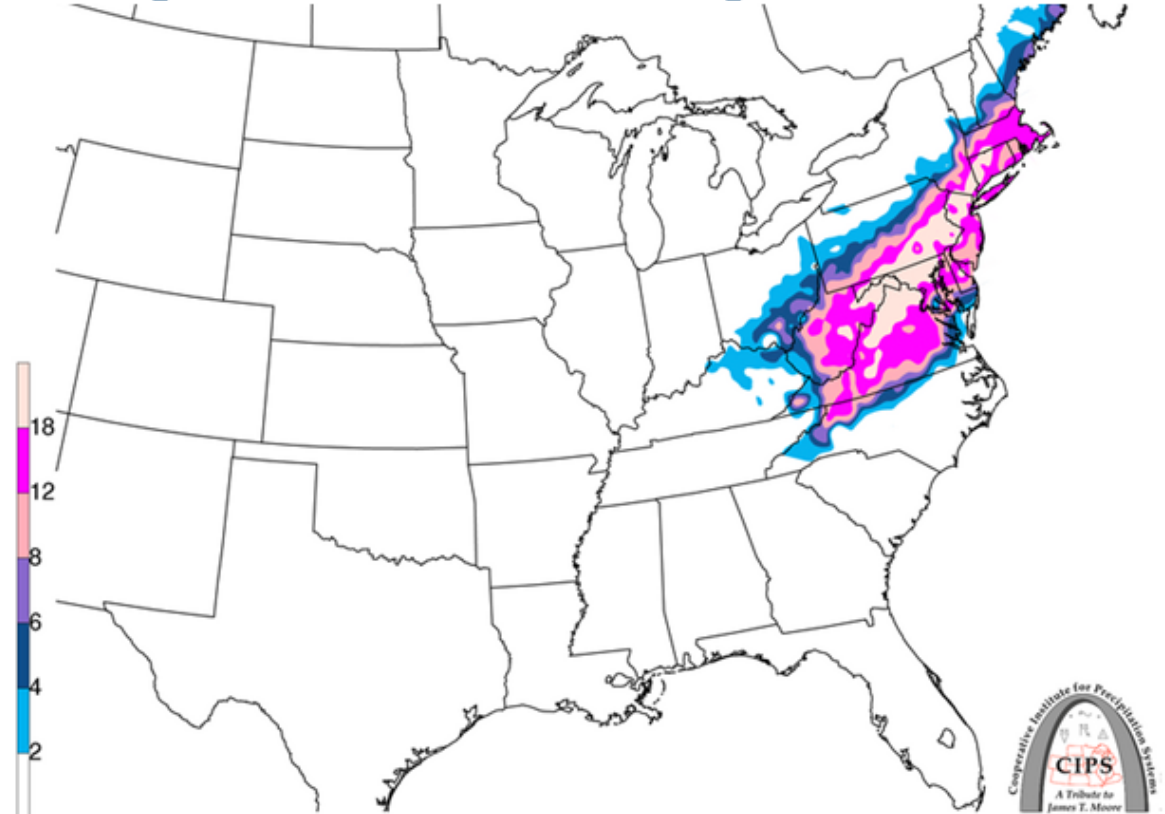

# Analog can be a useful forecast tool.

**Obs Snow – Dec 2009 Event**

20091221 Snow Event 096h ending at 1200 UTC

**Analog Obs Snow – 96-h ending 19830213/1200**

Snow Event for the 96-h period ending 1200 UTC 19830213

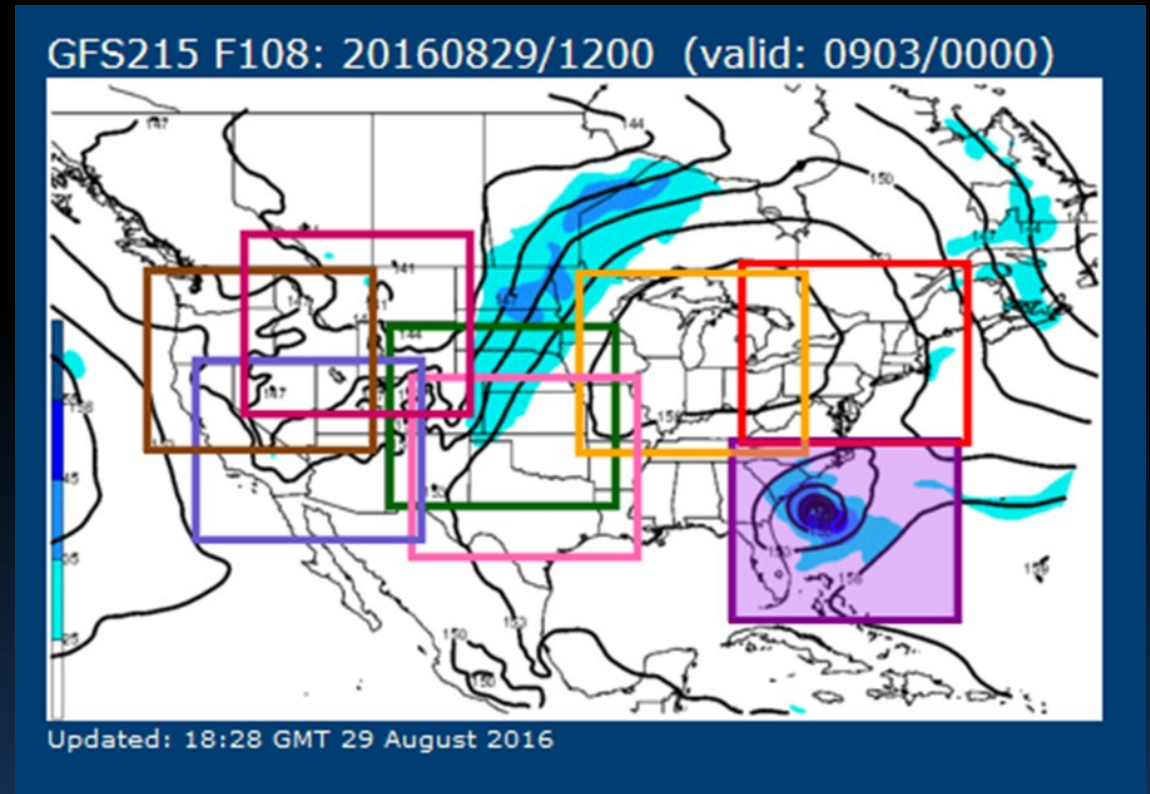

# Limitations of Analogs

- Analogs depend upon the accuracy of the model.
- Analogs are NOT forecasts.
- A perfect analog match is usually NOT possible.
- Potential impacts are just that...potential.
  - Biases in reporting
  - Data convergence

# Cooperative Institute for Precipitation Systems (CIPS) Analog Guidance

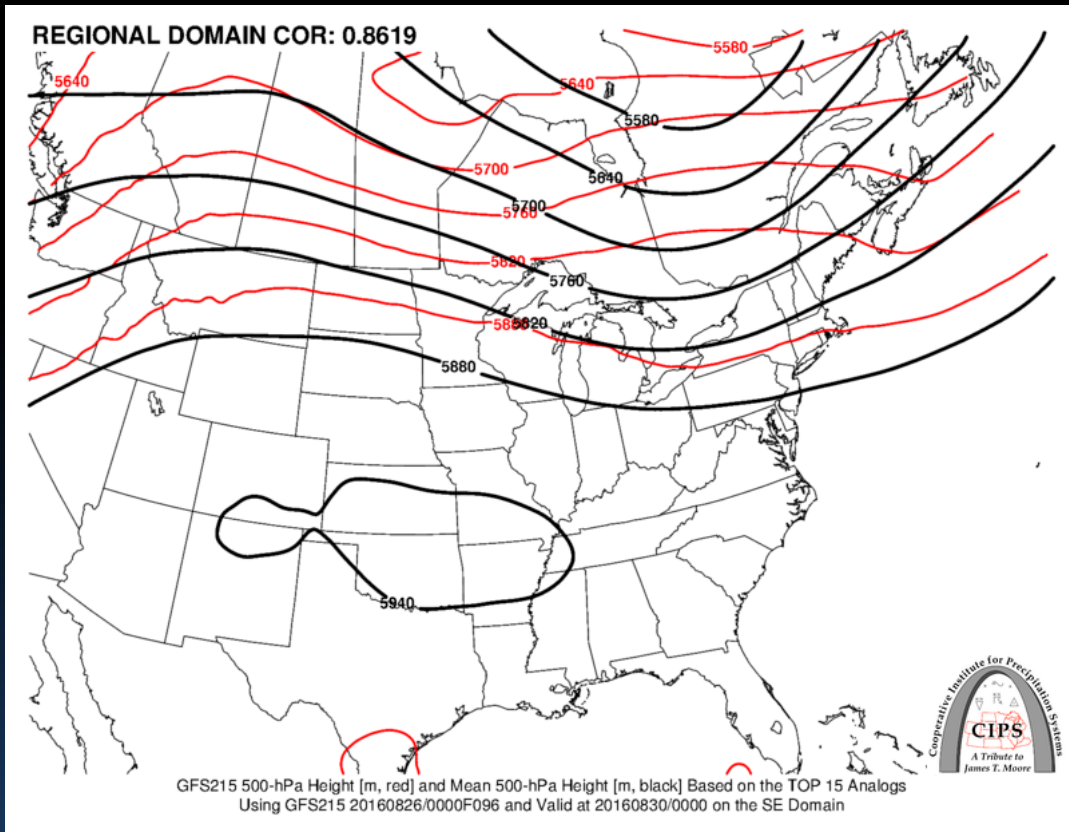

- Maintained by Dr. Charles Graves, St. Louis U.
- One of the best analog archives.
  - 10 day running archive.
  - Runs twice a day through 120-132 hours.
  - Different domains.
- Searches the NARR (1979-2014) against the NAM/GFS for potential analogs.
  - Top 15 best correlated analogs are found.

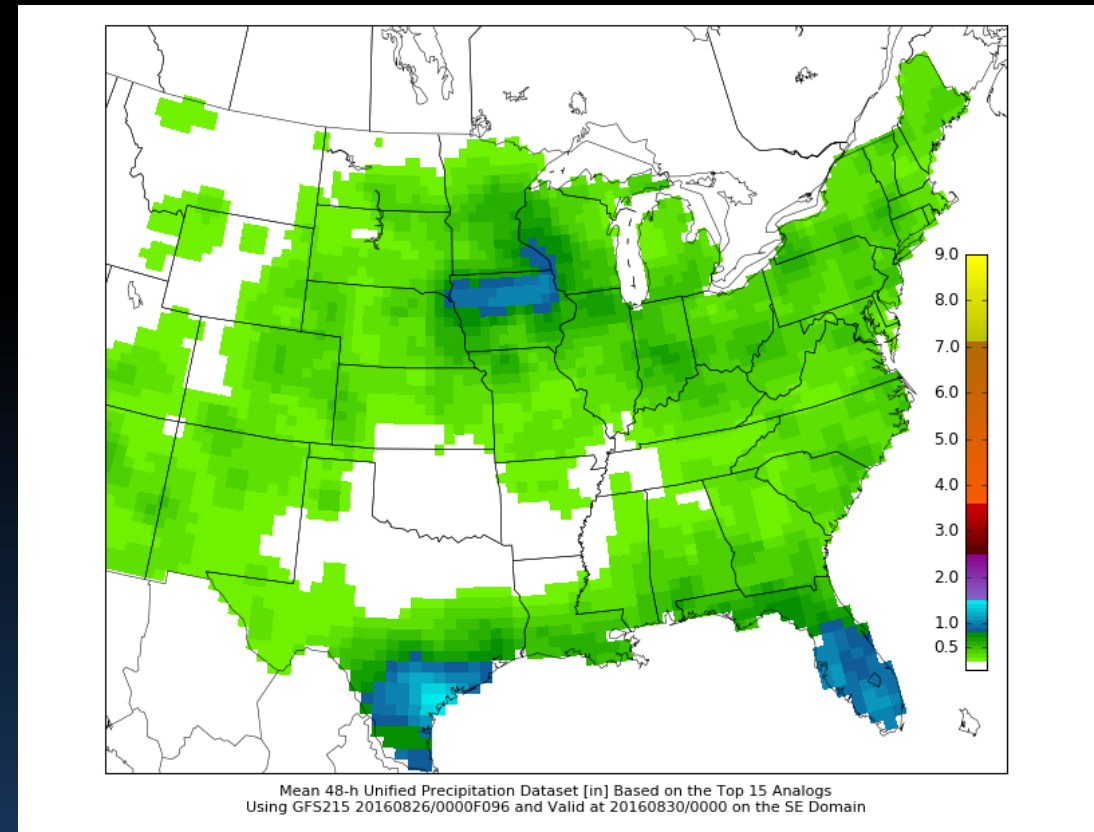

# CIPS Short Range Analog Example

## valid at 08/30/16 00Z

### 500 mb Height

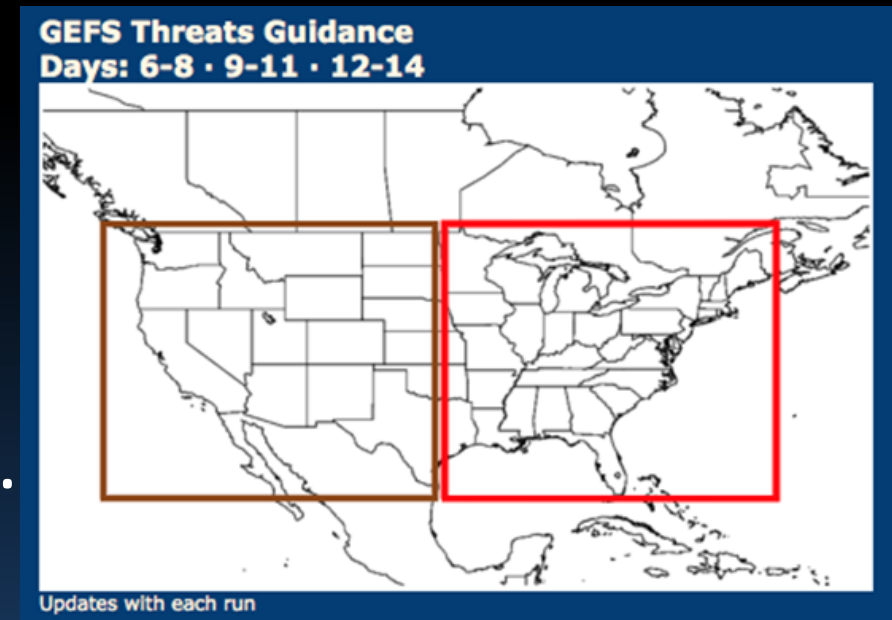

### 48-hour Pcpn

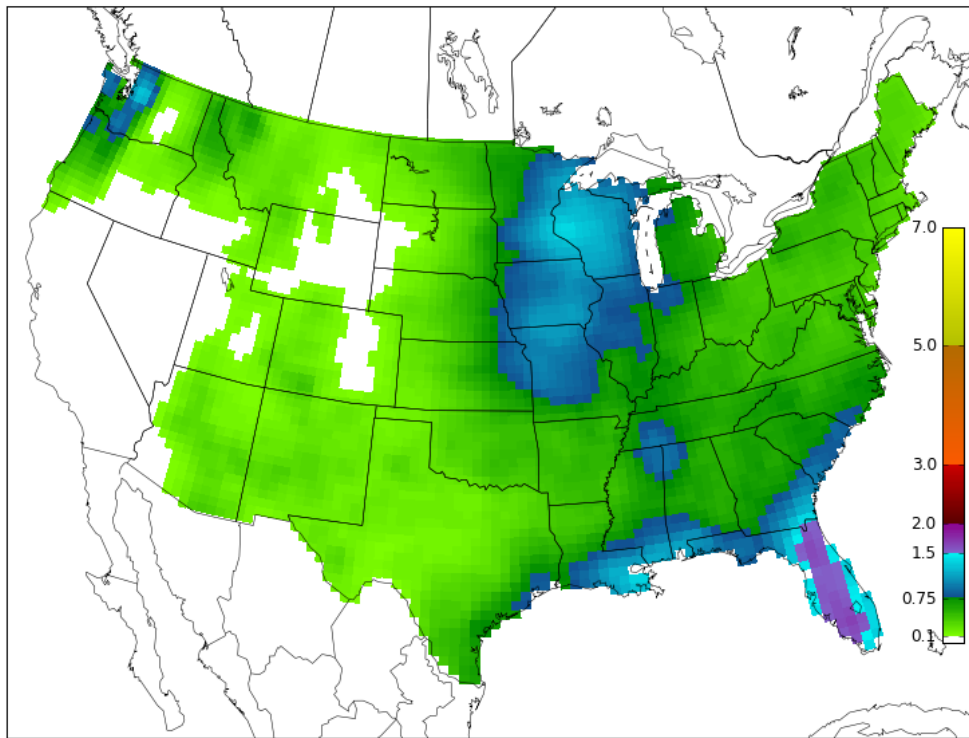

# CIPS Extended Analog Guidance

- Three sets of extended analog guidance using the GEFS ensemble (6-8 day, 9-11 day, and 12-14 day) are run once a day (00Z) for 2 domains.
- Top 5 analogs from each GEFS member.
- Guidance is based off these 105 analogs.

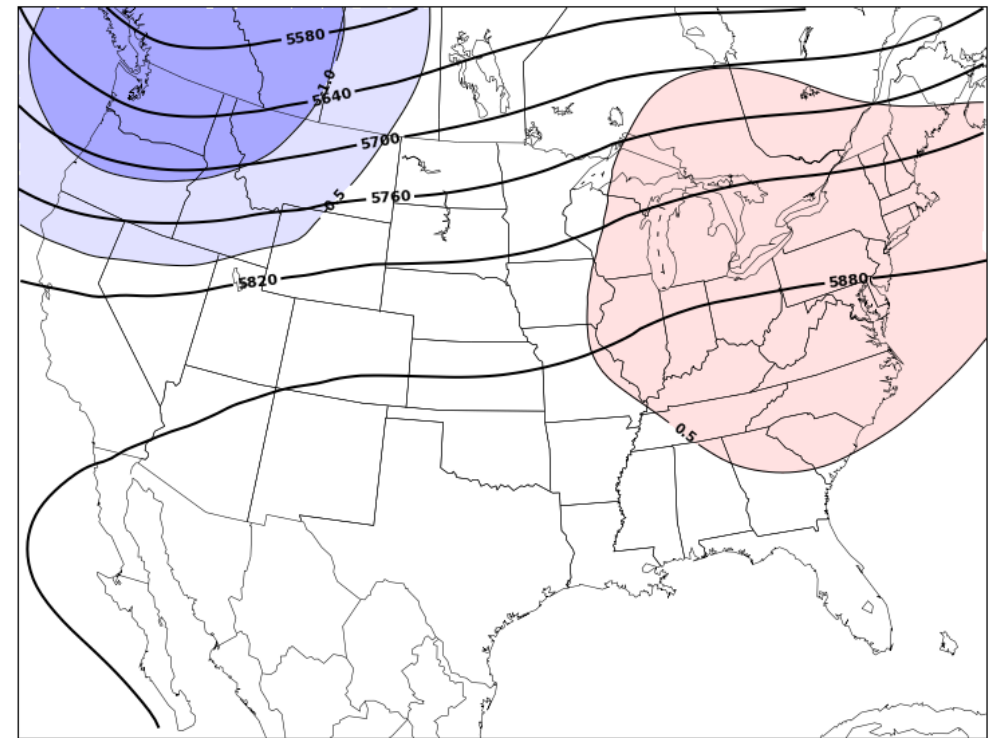

# CIPS Extended Analog Example

## 72-hour Mean QPF

9-11 Day Mean 72-h Unified Precipitation Dataset [in] of 105 Analogs Based on the Top 15 Analogs from each GEFS Member Centered on 20160829/0000F240 and Valid 20160908/0000

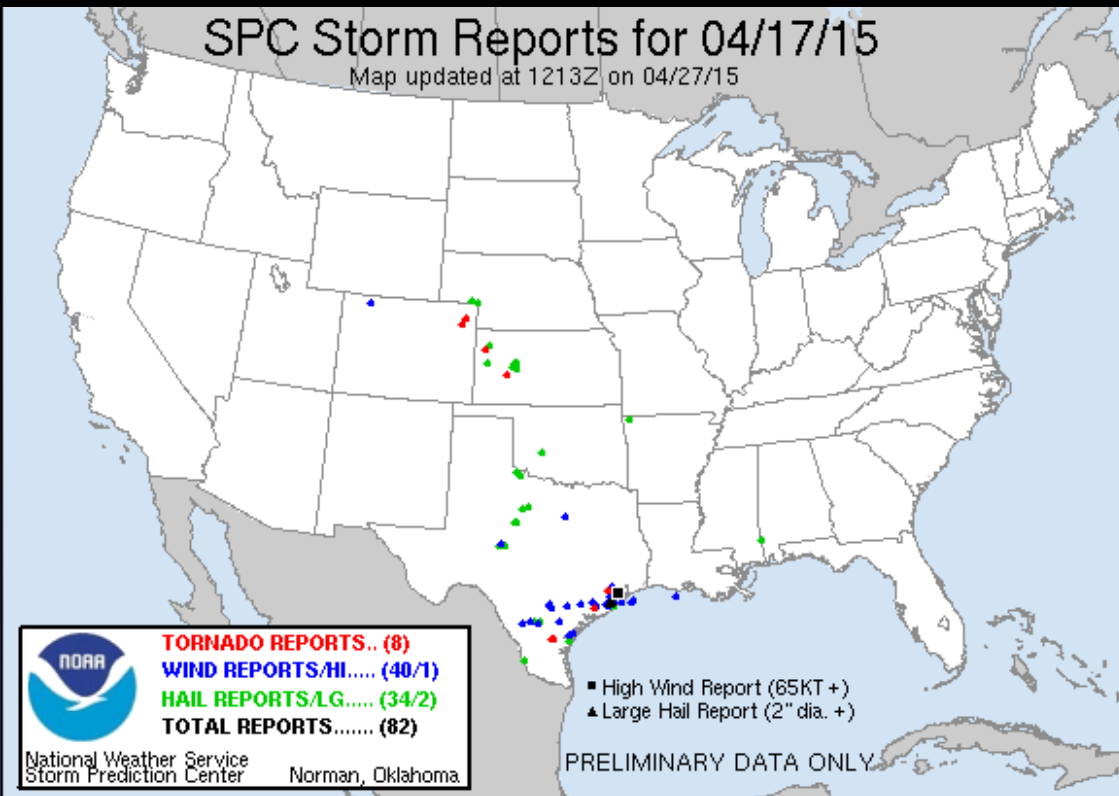

## Mean 500 mb Height/Standard Anomaly

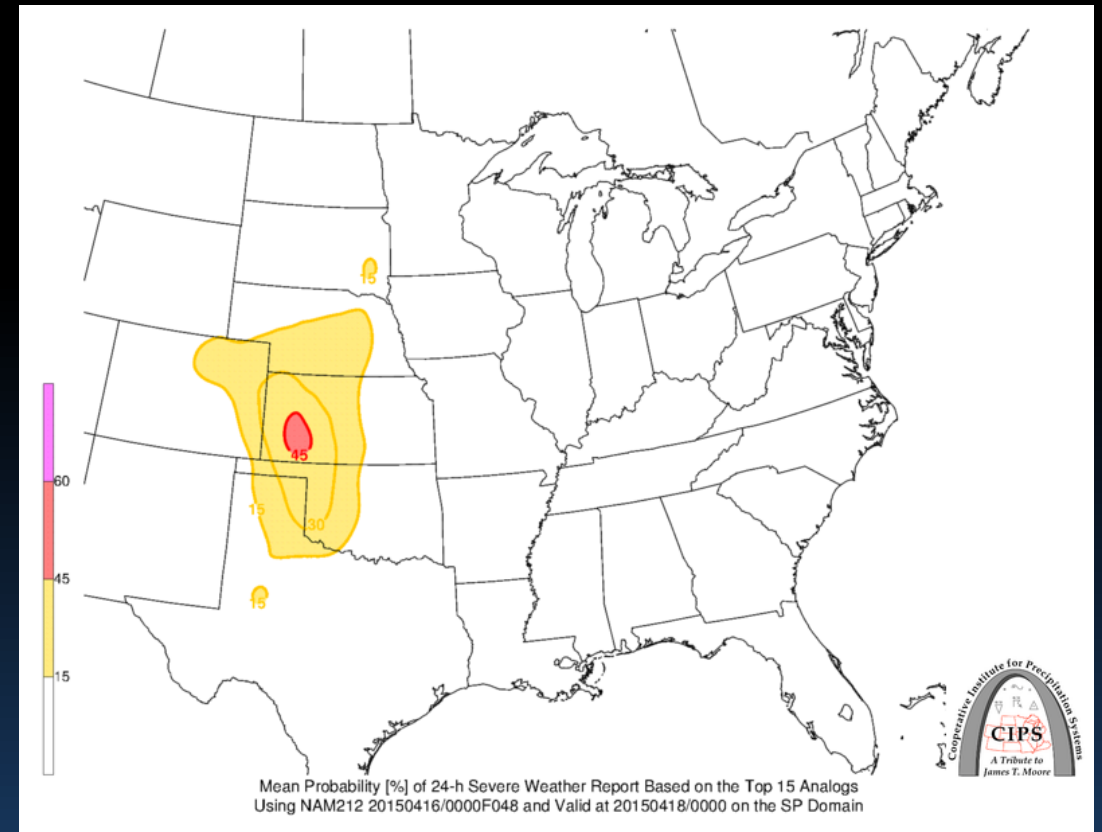

Mean 500-hPa Height [m] and Standard Anomaly [ $\sigma$ ] of Top Analogs Based on Top 5 Analogs from each GEFS member centered on 20160829/0000F240 and Valid at 20160908/0000

# Analog Fail

## Widespread Severe Wx across CRP CWA

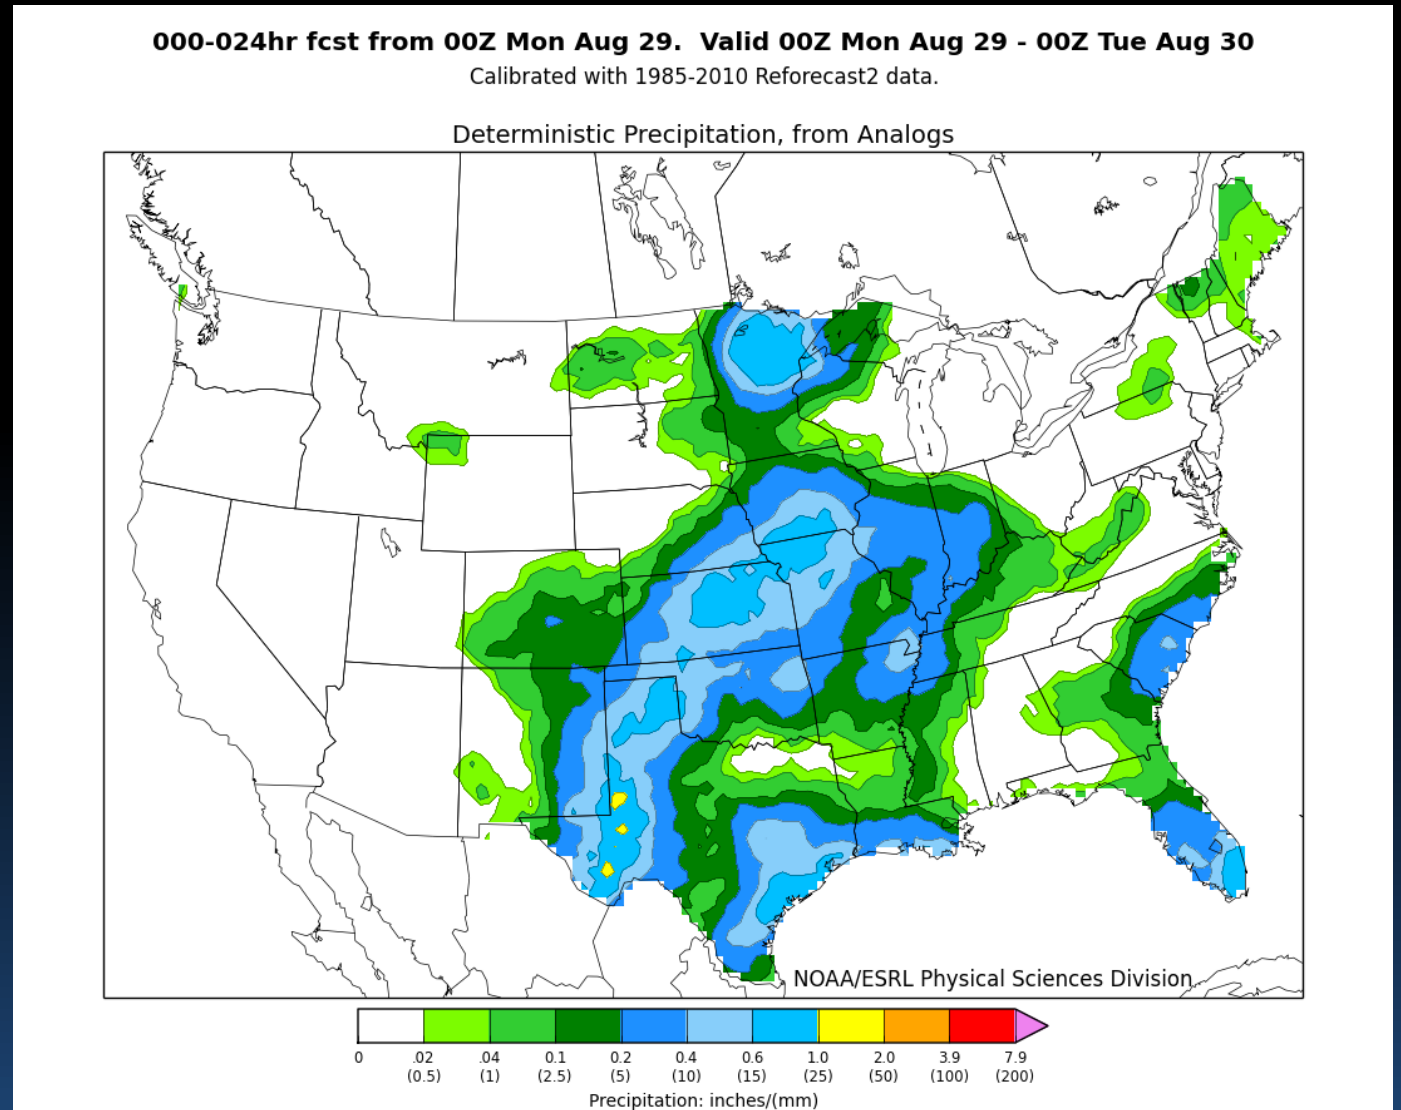

## Mean Prob of SVR WX Reports was 0%

# ESRL GEFS Reforecast Analogs

- Compares the current GEFS with past GEFS reforecasts to find analogs.
- From these analogs, probabilities are calculated based on NARR analysis.

# ESRL High-Res GEFS Reforecast Pcpn Analogs

- GEFS Reforecasts & Climatology-Calibrated Precipitation Analysis.

**012-024hr fcst from 00Z Tue Aug 30. Valid 12Z Tue Aug 30 - 00Z Wed Aug 31**

Probability of Precip > 10mm. CSGD. 2002-2013 CCPA and Reforecast2 Calibration.

**012-024hr fcst from 00Z Tue Aug 30. Valid 12Z Tue Aug 30 - 00Z Wed Aug 31**

Probability of Precip > 10mm, from 2002-2013 CCPA and Reforecast2 Calibration.
