# Flood Inundation Mapping Overview

# National Weather Service

Mission accomplished by multiple levels

# Why Use Flood Inundation Mapping?

- Change the way we communicate flood forecasts and associated impacts
- Improve how we can protect lives and property

# Map vs. Text

FLC097-292345-

/O.EXT.KMLB.FL.W.0006.00000T0000Z-220930T1926Z/  
/SHIF1.3.ER.220929T0557Z.220929T1200Z.220930T1326Z.NR/  
735 AM EDT Thu Sep 29 2022

...FLOOD WARNING NOW IN EFFECT UNTIL TOMORROW AFTERNOON...

\* WHAT...Major flooding is occurring and major flooding is forecast.  
This approaches the flood of record.

\* WHERE...Shingle Creek At Campbell.

\* WHEN...Until tomorrow afternoon.

\* IMPACTS...At 62.3 feet, Water enters many homes in Good Samaritan  
Village. Water approaches Sherwood Forest manufactured homes.  
Streets in Camelot and Sherwood Forest not navigable by regular  
vehicles. Property and roads in southern Old Town receiving water.

\* ADDITIONAL DETAILS...

- At 7:15 AM EDT Thursday the stage was 62.2 feet.
- Recent Activity...The maximum river stage in the 24 hours  
ending at 7:15 AM EDT Thursday was 62.2 feet.
- Forecast...The river is expected to fall below flood stage  
late tomorrow morning and continue falling to 58.6 feet early  
Saturday morning.
- Flood stage is 60.0 feet.
- <http://www.weather.gov/safety/flood>

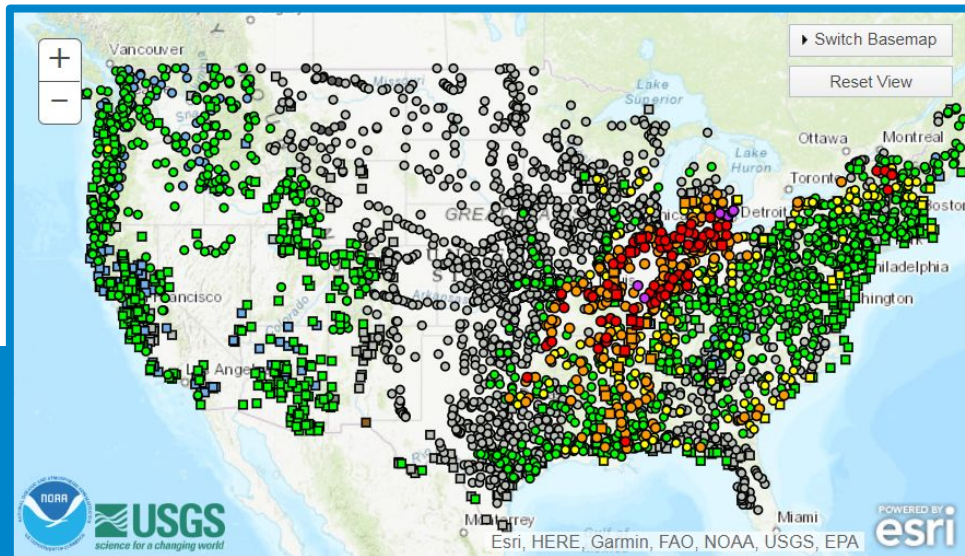

&&

Location	Fld		Observed Stg	Day/Time	Forecasts (8 am)				
	Stg	Stg			Fri	Sat	Sun	Mon	Tue

Campbell	60.0	62.2	Thu 7 am		60.8	60.1	MSG	MSG	MSG

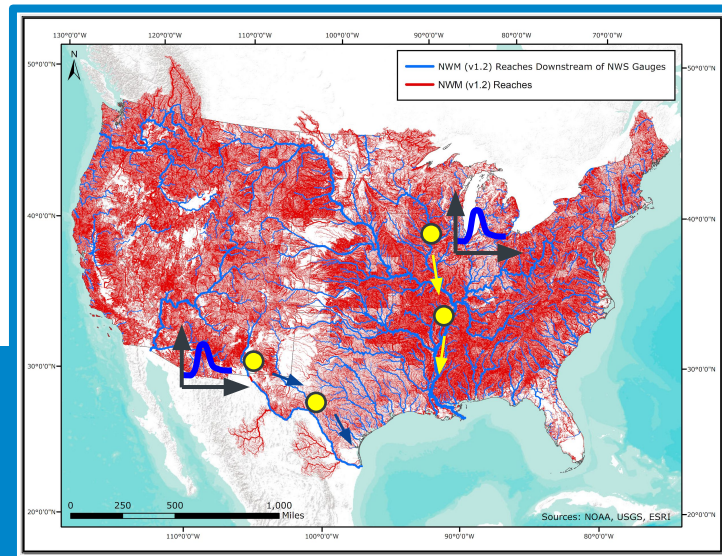

# Evolving Water Prediction Capabilities

~3,600 NWS River Forecast Points

Traditional NWS River Model

~1 forecast point for every 1,000 river miles

~2.7M NWM River Forecast Points

National Water Model (NWM)

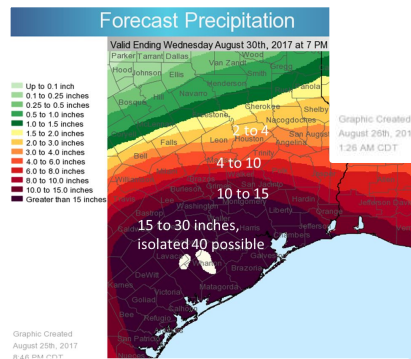

*Note there are 3.4M river miles in the U.S.*

# Example: Hurricane Harvey--2017

- Flood warning polygons provide value but they don't give the whole picture
- Flood inundation mapping would have painted a better picture about potential impacts
- Better at answering questions...
  - Do we have to evacuate the assisted living facility?
  - How many houses are going to flood?
  - From where should we bring swift water rescue teams?
  - How bad is it going to be?
  - How much worse will it get?
  - What's your reasonable worst case scenario?
  - When can we get into the area that flooded?

Flood Watches Warnings and Advisories

# Example: Asheville, NC / Helene--2024

## Record Flooding Forecast in Asheville, NC

Friday, September 27, 2024  
12:45 AM EDT

Life Threatening Flooding Possible

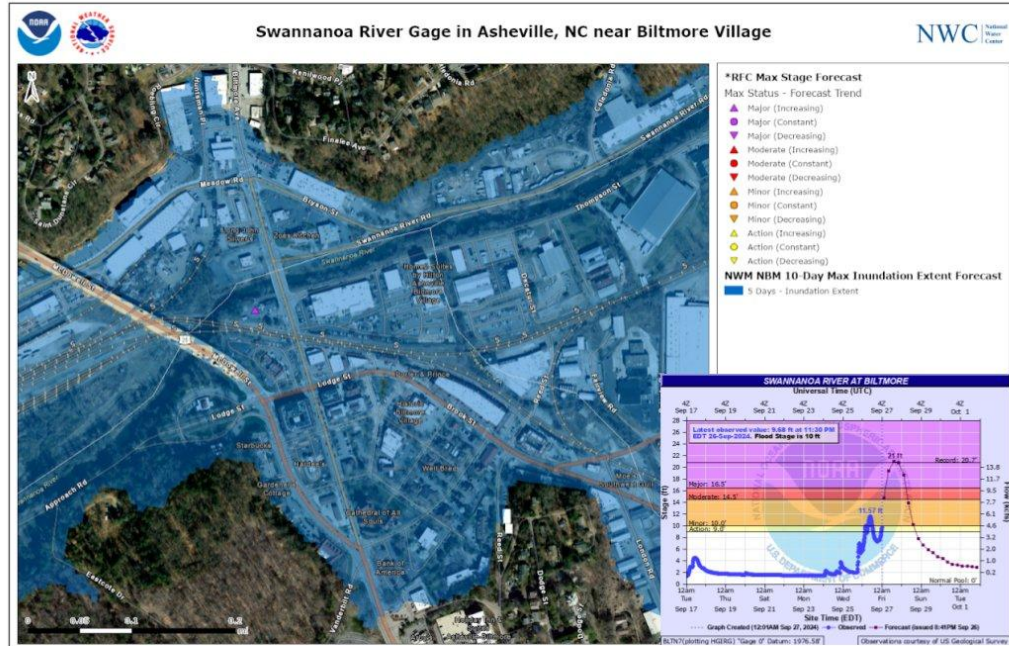

### Key Messages

- Record flooding is forecast along the Swannanoa River
- Life threatening flooding may be possible
- Flood inundation mapping suggests widespread flooding in the Biltmore Village area of Asheville (shown in blue in the image on the right)
- To escape rising water, take the shortest path to higher ground.

### Timing

- Flooding is ongoing and expected to crest Friday evening at record stage

National Oceanic and  
Atmospheric Administration  
U.S. Department of Commerce

National Weather Service  
National Water Center

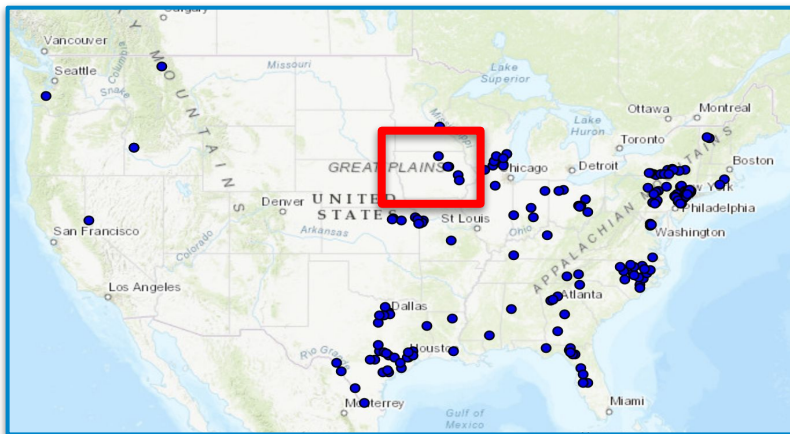

# NWPS Partner Flood Inundation Mapping

NWPS Partner Flood Inundation Mapping Libraries (NWPS Partner FIM) – Static maps at ~200 NWS river forecast locations. Maps derived from engineering scale hydraulic models.

< 1,000 miles

## Locations in Iowa

- **Winnebago River at Mason City**
- **Iowa River at Iowa City**
- **Cedar River at Cedar Falls**
- **Cedar River at Waterloo**
- **Cedar River at Cedar Rapids**

There are five Iowa Flood Center inundation libraries in Iowa as shown above

# NWS FIM Capabilities

Static

**NWPS Partner FIM Libraries (NWPS Partner FIM)** ~200 NWS river forecast locations. Shows the flood extent & depth based on a river crest of X feet. This is a hydraulic-based FIM which can be used with high confidence.

**NWS Flood Categorical HAND FIM Libraries (CatFIM)** ~3,000 NWS river forecast locations. Maps derived from 10 m Height Above Nearest Drainage (HAND) solution. (Currently scheduled for public launch in Spring 2024)

Dynamic

**Forecast River Forecast Center Flood Maps (RFC 5-Day Max Forecast)** downstream of ~3,600 NWS river forecast locations. Maps derived from traditional NWS river forecasts and 10-m Height Above Nearest Drainage (HAND) solution.

**Forecast National Water Model Flood Maps (NWM 5-Day Max Forecast)** along NHDPlus reach locations. Maps derived from NWM forecast and 10-m Height Above Nearest Drainage (HAND) solution.

**National Water Model Latest Analysis (AnA) Flood Maps** - utilizing observed rain and stream data to depict current flood extent. Maps derived from 10-m Height Above Nearest Drainage (HAND) solution.

## Coverages

< 1,000 miles

~30,000 miles

~110k miles

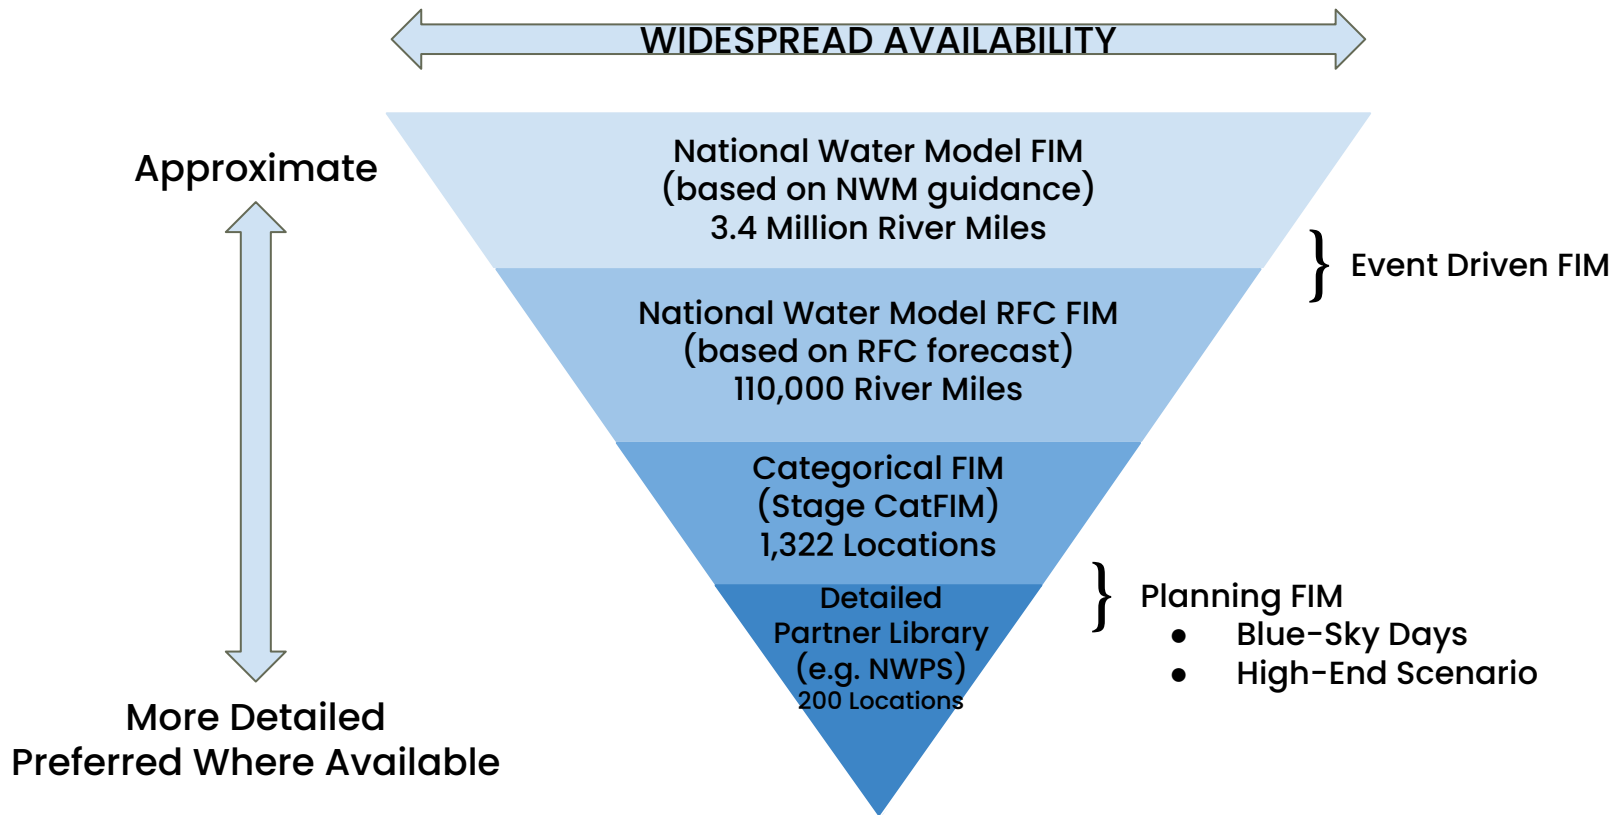

~3.4M miles

~3.4M miles

# Confidence and Flood Inundation Mapping

# Interpreting NWS FIM

*What is flooded?*

*How deep will the water be?*

Flood Impacts & Photos

[Collapse](#)

If you notice any errors in the below information, please contact our Webmaster

- Water reaches the bridge next to the gage house.
- Water reaches major flood stage. There is 1 to 2 feet of water in homes and vacation properties near Warrensburg. Route 418 is under water in several locations. Sections of the highway are flooded along the right bank of river mostly upstream of gage.
- Water is over Tannery Road.
- Water reaches moderate flood stage. Water surrounds several homes on Schroon River Road.**
- Water reaches minor flood stage with water in nearby lowlands and outbuildings.
- Action stage. The river is near bankfull.

# NWM Latest Analysis (AnA)

- Depicts closest reasonable inundation extent at the current time for locations exceeding the high water threshold
- High water threshold varies by region
- Latency (timing): ~80 minutes after top of every hour
- Limitation: reliability decreases in ungauged areas (or other data voids) where analysis cannot be tuned to observed information

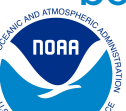

# RFC 5-Day Max Inundation Forecast FIM

- Depicts maximum inundation extent over the next 5 days derived from the official River Forecast Center (RFC) forecast
- Maximum streamflows are available downstream of NWS river forecast points whose forecast reaches Action Stage or higher flow threshold categories
- Latency (timing): ~45 minutes after forecast is issued
- Limitation: only available downstream of NWPS forecast points

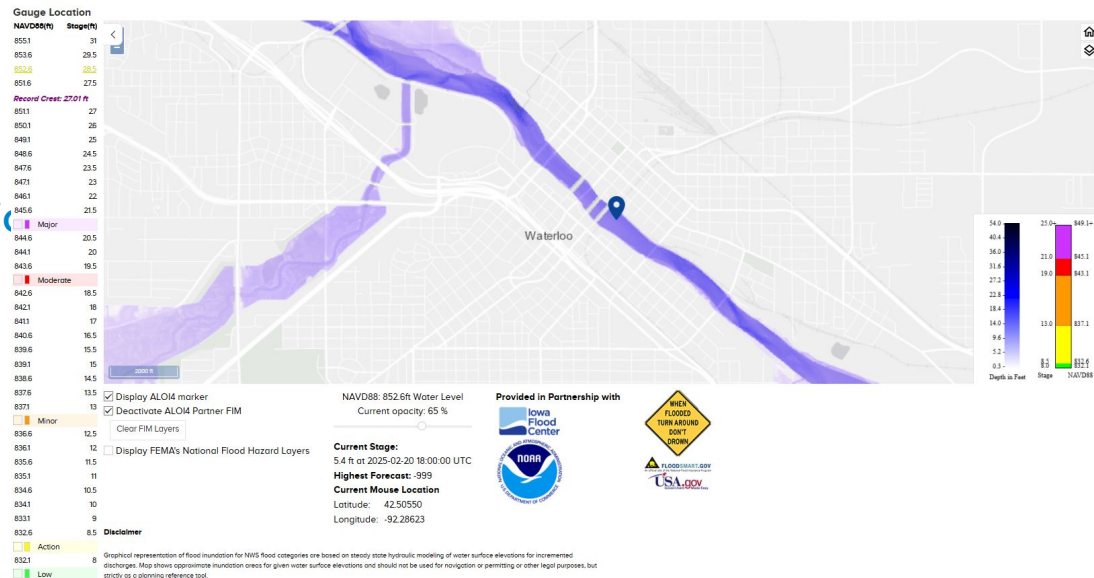

# NWM 5-Day Max Forecast FIM

- Depicts inundation extent of peak National Water Model (NWM) streamflow forecast over the next 5 days where NWM is producing flows that meet or exceed high water threshold for a given river reach
  - High water thresholds vary by region
  - Latency (timing): ~30 minutes after 12Z, 18Z, 00Z and 06Z
  - Limitation: Quality Control (QC) limitation exists because no forecaster is involved in decision-making process regarding forecast
- 
- 

# NWPS Partner FIM

- Uses hydraulic modeling
- Not based on real-time river forecasts
- Availability: Nearly 200 sites nationwide
- 5 miles up / downstream
- High resolution (< 10 m)
- Extensively calibrated, verified
- Limited inundation of neighboring tributaries

# IOWA FLOOD CENTER Flood Inundation Mapping

A critical resource to help citizens, emergency managers, community leaders and decision-makers identify and communicate Iowa's flood hazards and support informed floodplain management decisions.

## Statewide Maps

- A collaboration with Iowa DNR, USACE and FEMA to update flood maps for every Iowa county. IFC researchers used laser radar (LiDAR) data provided by Iowa DNR to map all streams draining more than one square mile.

## Community Maps

- IFC has developed flood inundation maps for dozens of Iowa communities that translate forecasted river stages into high-resolution, interactive, scenario-based maps.

IFIS

Statewide flood inundation map of 200-year flood

Community map, Independence, IA

**IOWA**

# CatFIM

- Static inundation extent mapping library
- May be available at 1 ft increments or in the official NWS flood stage category thresholds (Action, Minor, Moderate, Major and Record)
- An invaluable tool for emergency planning and informing best practices for anticipation of potential future flood events
- Only available at select sites

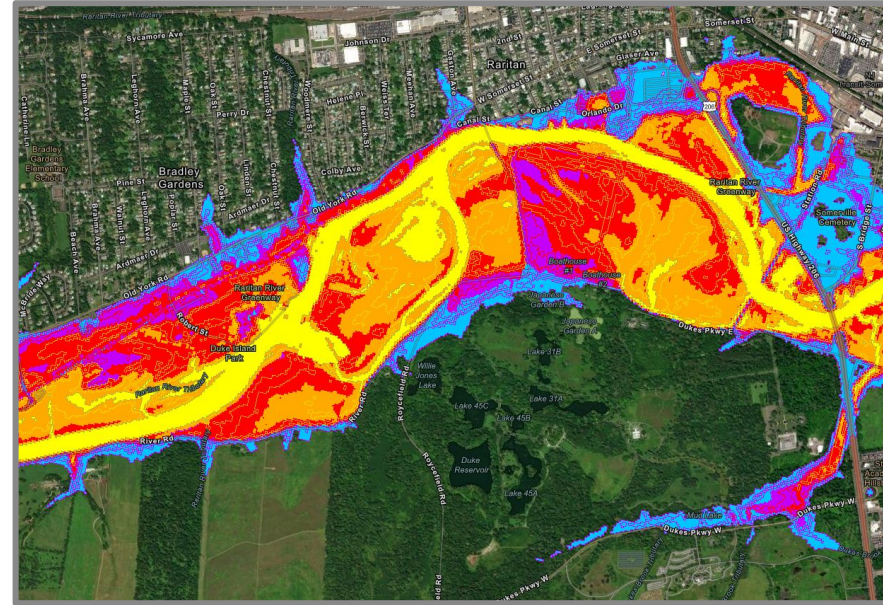

TARN7

# Stage-Based CatFIM

- Derived from NWM per HAND
- Not based on real-time river forecasts
- Limited availability (official NWS forecast points only)
- Inundation extent at 1 ft intervals
- Includes local flood categories
- 5 miles up / downstream
- 10 m resolution
- Uses USGS rating curves to establish the water surface elevation at the streamgauge
- Planning / reference / what-if

# Flow-Based CatFIM

- Derived from NWM per HAND
- Not based on real-time river forecasts
- Limited availability (official NWS forecast points only)
- Inundation extents at NWPS thresholds
- 5 miles up / downstream
- 10 m resolution
- Uses SRCs to determine stage throughout the reach and thus is subject to SRC error
- Planning / reference / what-if

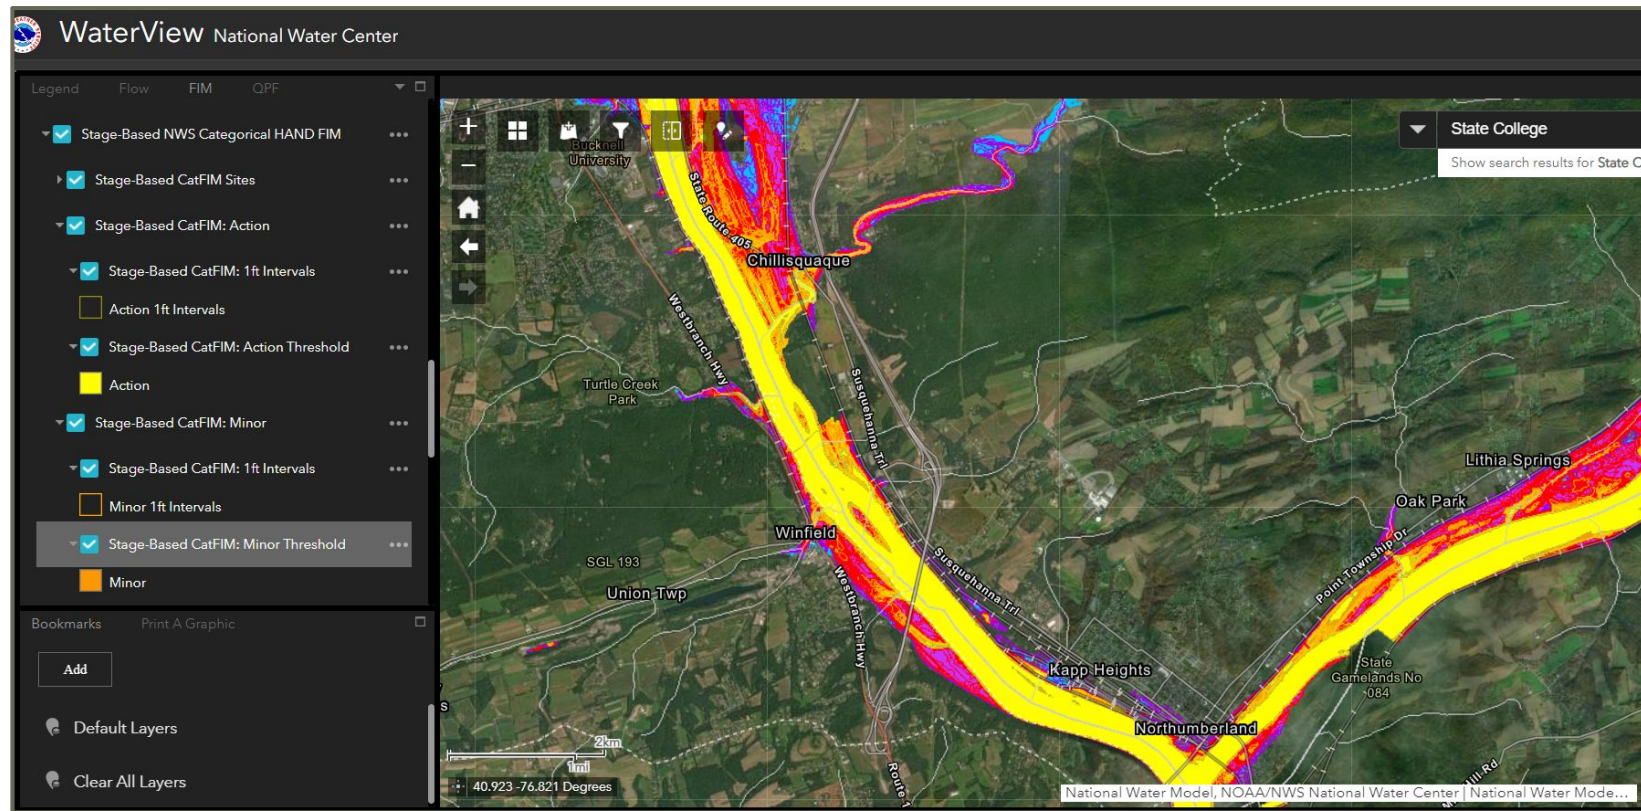

# Stage-Based CatFIM

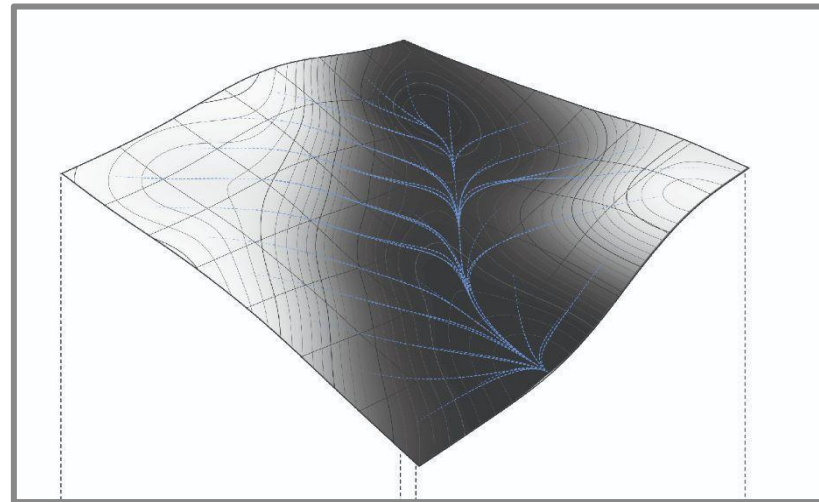

# Stage-Based CatFIM

# HAND (Height Above Nearest Drainage)

Identify Stream Reaches

Segment into 1.5 km flow lines from the Digital Elevation Model (DEM)

# HAND (Height Above Nearest Drainage)

Generate Slope & Flow

Using the DEM, begin the process of hydro conditioning

# HAND (Height Above Nearest Drainage)

## Delineate a Drainage Network

Creating the drainage network delineating the discrete catchments  
draining into each channel thalweg cell

# HAND (Height Above Nearest Drainage)

Convert Channel Elevation to Zero

Relating the elevation of the terrain to the elevation of the zero reference point  
(the channel thalweg)

# HAND (Height Above Nearest Drainage)

Calculate HAND for each catchment

Depict the elevation of the surrounding terrain above the river to which it drains

# HAND (Height Above Nearest Drainage)

Compute the Relative Elevation Model

Each cell indicates the water depth needed to inundate that cell

# HAND Method: Process

- Strengths
  - Used for many FIM services
  - Fundamental and reliable method
- Limitations
  - Not a hydraulic model (zero physics)
  - Lack of bathymetry
  - FIM inaccuracies exist at / near levee areas
  - HAND does not account for backwater effects
  - HAND does not produce accurate waterbody inundation
  - Catchment boundaries can cause underestimation of inundation extents
  - Catchment boundaries can cause overestimation of inundation depths

# Flow-Based vs Stage-Based CatFIM (animation)

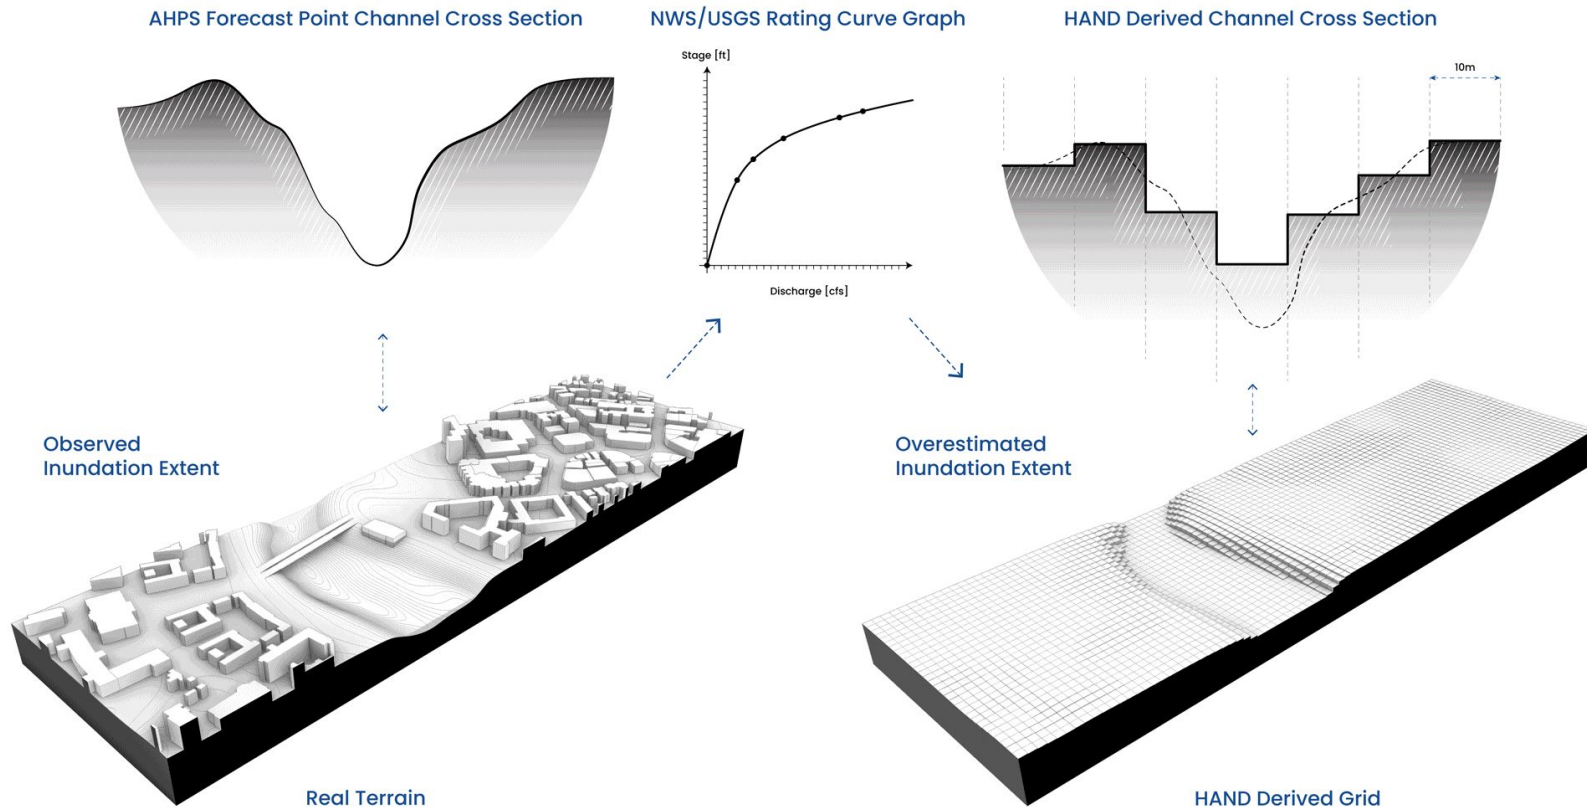

## Flow-Based CatFIM

## Stage-Based CatFIM

# NWPS vs HAND Inundation Comparison (animation)

# General FIM Limitations

- FIM is not perfect even though the maps can look neat
  - FIM may suffer from inaccuracies arising from issues with the modeling, elevation/landscape data and building/road placement
  - FIM may also suffer from inaccuracies in the input stream forecasts
  - Please coordinate with us leading up to and during flood events so that you can make the best-informed decisions
- FIM is based on landscape conditions at the time it was developed
  - FIM accuracy may be reduced if natural or man-made changes (permanent or temporary) occur to the river channel or flood plain afterwards
  - Examples: development, modification, failure or removal of flood protection systems such as levees, floodwalls or the development, modification, failure or removal of bridges and dams

# General FIM Limitations (cont'd)

- NWS FIM is designed to address flooding from waterways such as rivers and streams (i.e., fluvial flooding) –not from flash flooding due to rapid runoff from rainfall such as in urban areas or in fields (i.e., pluvial flooding)
- NWS FIM is not designed for inundation resulting from ice jam flooding
  - With ice jams there can be local fluctuations in stage caused by the ice itself, not by the river flow
- NWS FIM--when compared to the regulatory FEMA Digital Flood Insurance Rate Maps (DFIRMs)--will depict different flooding scenarios
  - The differences occur because FIM and FEMA maps have been designed for different purposes and were developed based on different assumptions

# Strengths of RFC and NWM FIM

- Visualizes flood forecasts and impacts for every river across the nation (including Alaska, Hawaii, Puerto Rico and the Virgin Islands)
- Creates a common picture of the river/stream flood threat in a given area
- Improves ability to target areas and preposition resources (regional, not local)
- Large scale regional response and reaction
- National, regional and county partners

***“Had I have had this tool in 2011, we would have had a larger evacuation area established earlier, would have moved emergency assets out of the flood zone, pre-positioned support resources and been able to provide better information to the residents of the affected area.”***

***- County Emergency Manager***

# Limitations of RFC and NWM FIM (cont'd)

- Extent only
  - Number 1 question about flooding after “where?” is “how deep?” Depth is not currently part of NWS FIM but is planned for the future
- Limited to 10 m digital elevation model
  - Can’t see small physical features and their impact on FIM extent such as small ridges, bridges or unofficial levees
- Simplified physics
  - Equations describing the physics are simpler with more assumptions as compared to hydraulic models like HEC-RAS
  - Height Above Nearest Drainage (HAND) technique limitations

# Limitations of RFC and NWM FIM (cont'd)

- NWM versions limited by quantitative precipitation forecast (QPF) input
  - The rainfall creating the flow is currently only Global Forecast System
  - Can't adjust or manipulate the forecast rainfall going into the model
- NWM Versions flow has no human influence for the forecast
  - Similar to being unable to adjust the rainfall, NWM version has no ability to adjust the flow generating the map
- Coastal use is limited
  - Current FIM capabilities are only able to address freshwater flooding
  - *Total Water Level FIM derived from a coastal coupled NWM approach is under development*

 National Weather Service Flood Inundation Map (FIM) Resources and Services	<b>Reference Maps (“Blue Sky”)</b> (These maps are always available; not forecast dependent depend on forecasts)		<b>Forecast Maps (“Dark Sky”)</b> (These maps are <u>only</u> available when flood/near-flood is forecast)

<b>When should I use it?</b>	<ul style="list-style-type: none"> <li>• Ongoing flooding</li> <li>• 1-3+ days prior to flood, for “what-if” planning</li> <li>• “Blue sky” reference</li> </ul>	<ul style="list-style-type: none"> <li>• Ongoing flooding, where NWPS Partner FIM is unavailable</li> <li>• 1-3+ days prior to flood, for “what-if” planning</li> <li>• “Blue sky” reference</li> </ul>	<ul style="list-style-type: none"> <li>• Ongoing flooding, where NWPS Partner FIM is unavailable</li> <li>• 1-2 days prior to flood, if NWS river forecast confidence is high</li> </ul>	<ul style="list-style-type: none"> <li>• Ongoing flooding, where no other FIM is available</li> <li>• Post-flood analysis, up to 14 days after flood</li> </ul>	<ul style="list-style-type: none"> <li>• Ongoing flooding, where no other FIM is available</li> <li>• 1-2 days prior to flood, for streams where no other FIM is available</li> </ul>

# Reservoir Impacts on FIM

- Reservoir operations and outflows impact NWM streamflow accuracy and as a result the resulting FIM – flows could change if there has been significant impact
- Several thousand reservoirs represented in NWM but in basic fashion
  - “Fill and spill”
- NWM uses two other data ingest approaches (direct insertion assimilation) to improve modeled outflows

# **Flood Inundation Mapping and Impact-Based Decision Support Services**

# FIM Use Before, During and After a Flood Event

Flood Inundation Maps (FIM):

# Putting Water On a Map

# FIM Impact-Based Decision Support Services (IDSS)

Increasing direct interaction with core partners based on various scenarios and needs

## Public Services

Providing the source of recommended FIM for the partner to ingest into their system (i.e. REST services via HydroVis).

## Baseline IDSS

Providing graphics, email packages, webinars, NWSChat, etc. to convey general impacts.

## Targeted IDSS

Providing targeted graphics, email packages, webinars, etc. to convey specific impacts based on specific needs and thresholds.

## Integrated IDSS

Providing onsite, integrated support within partner's operations with detailed impact information tailored needs and thresholds.

Most Common IDSS

# Understanding Disclaimers

Official Disclaimer: *"These experimental maps represent the NWS' best approximation of inundation extent based upon modeled river discharge."*

*"This map shows the flood extent based on a river crest of X feet. This is an approximate-based FIM which should be used more conservatively."*

*"This map shows the flood extent & depth based on a river crest of X feet. This is a hydraulic-based FIM which can be used with more certainty."*

*"This map does not have bridge inundation accurately represented. Reach out to NWS for any questions regarding bridge inundation."*

*"Local rainfall may also lead to flash flooding in this area that is not accounted for in this flood depiction."*

During Tropical Events please  
see the National Hurricane  
Center Forecast

Wind speed and direction may  
enhance areas of flooding  
along the river.

Map shows flood extent.  
Depth is NOT provided.

# Implementation Process

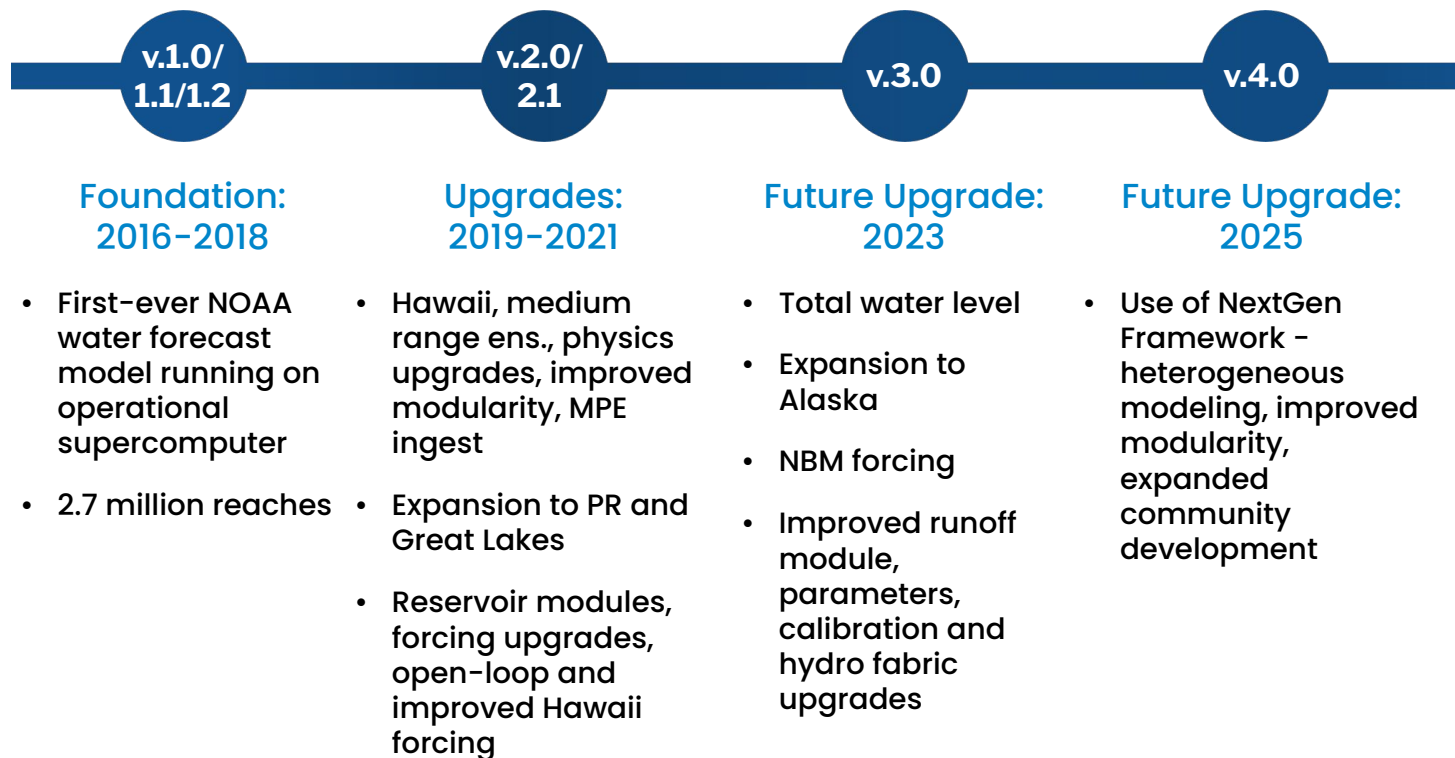

# Phased Implementation of FIM Services

Percent of U.S. population served by Flood Inundation Mapping (FIM) services

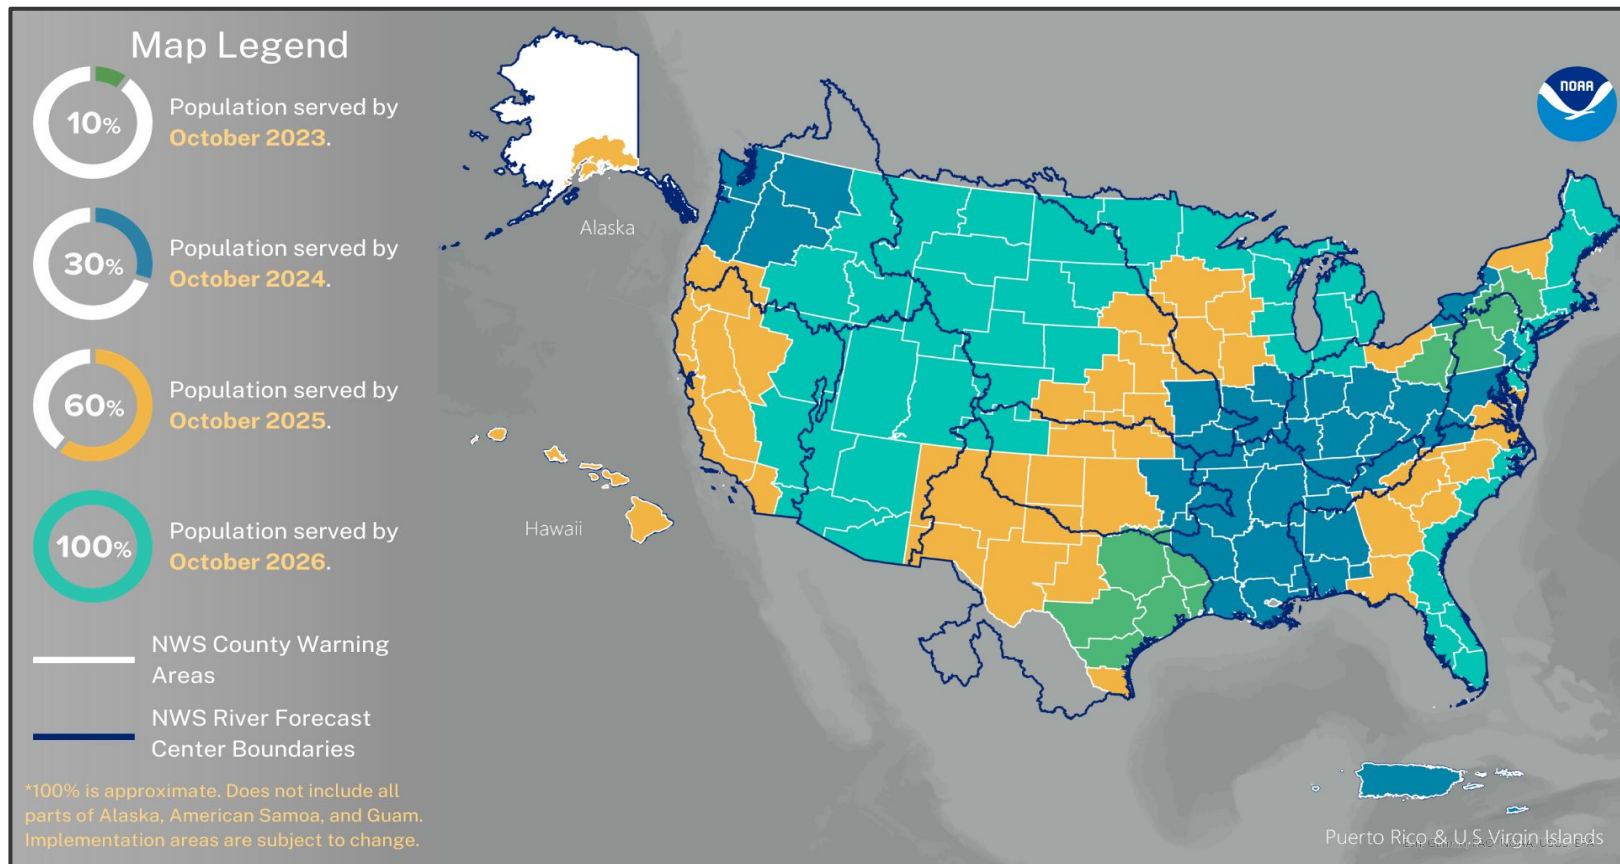

- By September 30, 2023: 10% of U.S. population
- By September 30, 2024: 30% of U.S. population
- By September 30, 2025: 60% of U.S. population
- By September 30, 2026: 100% of U.S. population
  - Including coastal coupling
