April 22nd – 27th Severe Storms

Austin - San Antonio Weather Forecast Office
A series of upper level disturbances with an active subtropical jet and dryline caused an active period of severe weather from April 22-27. Below is a breakdown of what happened:

- **April 22** – Storms formed across the Mexican mountains and then moved into the Rio Grande Plains. Strong to severe storms occurred mainly across the southern Rio Grande Plains and southern counties.

- **April 23** – Storms initialized once again across the Mexican mountains and moved across the Rio Grande Plains. Strong to severe storms occurred mainly over the Rio Grande Plains and southern Edwards Plateau.

- **April 24** – Strong thunderstorms formed early Friday morning along and east of Interstate 35. Heavy locally rain resulted in flash flooding across Bexar and southeastern counties of South Central Texas. Then later that evening, the threat of severe storms returned across the southern part of the Rio Grande Plains.

- **April 26 and 27** – An active subtropical jet with the combination of the dryline and pre-frontal trough resulted in another round of severe storms across the Edwards Plateau into the Interstate 35 corridor.

Beneficial Rainfall in April...

Summary

The heaviest rain (6-10 inches) fell east of the I-35 corridor.

The Edwards Aquifer is up 7 feet from April 1 to a level of 652 feet. Last time the aquifer was this high was June 2013.

Lake Travis is up about 1.5 Feet.
April 25th, 2015 – 2:00 pm

White streaks show where ground has been cooled by storms last night. See San Angelo Radar to the left!

Dark Spots are the urban heat Islands of Dallas, the I-35 Corridor, Austin, and San Antonio.
4 of our office’s biggest (based on size) storm based warnings were issued on April 27th.

Our biggest warning (12,527 mi$^2$/32,444 sq. km) is now the 5th biggest storm based warning ever issued by any of the 122 National Weather Service Forecast Offices.

Storm based warnings date back to October 2007.
