Bottom Line up Front!

- The threat for significant, impactful, snowmelt flooding is very low across all sub-basins and for the main-stem Red River.
- Current conditions and short-range climate forecasts indicate that minor flooding is the predominant risk.
- Dry conditions have persisted across the basin since last February.
- Soil moisture, base streamflow, and current snowpack in virtually all sub-basin areas are near to below normal.
- The second half of winter should be somewhat cooler and snowier than average. The NWS/CPC expects that Feb-Mar-Apr will have temperatures near-average and precipitation near-above average.

Long Story Short: The risk for significant snowmelt flooding is quite low, lower than long-term historical averages, across all of the Red River and Devils Lake Basin (U.S. portions).

Key Snowmelt Flood Components:

1. Base Streamflow: At or below normal. USGS analyses indicate that the Red River and its ND and MN tributaries are ice covered and/or flowing within long-term normal ranges, between 10th and 90th percentiles. Higher flows are generally tied to recent reservoir draw down/release schedules.

2. Soil Moisture at Freeze-up: Near to well below normal. Total precipitation (rain and snow-water) measured across the Basin from April 1st through Dec 1st ranged from 2 to 7 inches below the long-term normal for various sub-basins. Soil moisture at freeze-up ranged from below normal (10th to 30th percentiles) north and west of Grand Forks to near normal (30th to 70th percentiles) for sub-basins south of Grand Forks.

3. Frost Depth: Near normal. Dec-Jan cold snaps have driven frost from 12 to 24 inches deep in most areas. After a slow start to freeze-up, river-ice and lake-ice thicknesses are approaching seasonal normal ranges.

4. Winter Snowpack/SWE: Near to below normal. Since Dec 1st, snowfall has run from 25-125 percent of normal - least in the far south and in northeast ND. Current winter Snowpack and Snow Water Equivalent (SWE) are also highest across the central Red Basin and the Red Lake River Basin, lowest in the south and north.

Highest SWE ranges from around 1.5 to 2.5 inches from Mayville, through Grand Forks to the Lake of the Woods. Else, SWE tapers to less than an inch from Fargo southward and from Manvel north by northwest. Devils Lake Basin SWE ranges from 1 to 2 inches.
The current heights of Devils Lake and Stump Lake are ~1449.7 ft. MSL.

### DEVILS LAKE & STUMP LAKE...

---

### Notes

1. A one-half foot to one foot rise on Devils Lake is considered near climatological normals.

2. Central and northern Red River main-stem points will likely see slightly higher flows from higher snowmelt in the central valley and in northwest MN tributaries.

3. Some higher snowpack areas.

4. Mid and Upper Sheyenne is quite dry with low snowpack.

5. Some higher snowpack areas.
