Devils and Stump Lakes
Long-Range Probabilistic Outlook

The National Weather Service provides long-range probabilistic hydrologic outlooks for Devils and Stump lakes between January and September. They will not be provided between October and December. Depending on the season, the high or low water probabilities may be omitted due to their applicability to the hydrologic situation.

OUTLOOK SUMMARY...

The lake has fallen around two tenths after peaking in late June and early July around 1450.8 feet. A dry July has aided the recession with more evaporation than inflow into the lake system. Precip amounts in July were 25 to 75% below normal with a basin wide 1 to 3 inches observed where 3 to 4 inches is normal.

Climate outlooks indicate equal chances for any outcome for temperatures and precipitation for August through October with no strong signal for warm or cold and wet or dry.
A normal fall would allow the lake to fall 10 to 14 inches, the 25 to 75% chance levels of 1449.4 to 1449.8 ft. A dry fall would allow the lake to fall to around 1449.3 feet, a 5 to 10% chance.

Note: This outlook incorporates a daily average of 350 cfs worth of pumping operations on Devils Lake from June 1st through November 10th.

Chances of Devils and Stump Lakes Rising Above Given Lake Levels...

The probability of exceeding a given lake level is the percentage of maximum lake level rises that are above that level for all the years that were run through the model using the precipitation and temperatures for those years during the valid period of the outlook.

Note: The current gage zero datum of the Devils Lake at Creel Bay gage is 1401.33 feet NAVD88 or 1400.00 feet NGVD29. The gage zero datum of the Stump Lake at East Stump Lake gage is 1401.15 feet NAVD88 or 1400.00 feet NGVD29.

Probabilities for Exceeding Listed Lake Levels

FROM JULY 25, 2022 TO SEPTEMBER 30, 2022

Current and Previous Record High Lake Levels...

* The current height of Devils Lake is 1450.56 feet NGVD29.
* The current height of Stump Lake is 1450.60 feet NGVD29.

* The most recent USGS provisional record daily average height for Devils Lake at the Creel Bay gage:
  ...1454.30 feet on June 27 of 2011

* Previous records:
  ...1452.05 feet on June 27 of 2010
  ...1450.93 feet on June 27 of 2009
  ...1449.20 feet on May 9 of 2006
  ...1449.18 feet on June 17 of 2004
  ...1449.17 feet on August 2 of 2005

Note: All previous records are recorded in NGVD29.

Chances of Devils and Stump Lakes Falling Below Given Lake Levels...

The probability of not exceeding a given lake level is the percentage of lake level falls that are below that level for all the years that were run through the model using the precipitation and temperatures for those years during the valid period of the outlook.

Interpretation Aid: There is a 50 percent chance that Devils Lake will fall below 1549.4 feet during the valid period and only a 5 percent chance that it will fall below 1549.3 feet.

Probabilities for Non-Exceeding Listed Lake Levels

FROM SEPTEMBER 01, 2022 TO NOVEMBER 30, 2022
The non-exceedance value for a listed percentage is the value where that percentage of all model cases run were below that lake level for the specified valid period of the outlook.

OUTLOOK SCHEDULE...

- Between January and May, only the high water exceedances will be provided with valid periods ending at the end of September.

- Special Spring Flood and Water Management Outlooks will be issued in late February and early March.

- For June and July, both high-water and low-water exceedances will be provided.

- For August and September, only the low-water exceedances will be provided with valid periods ending at the end of November.

- No probability of exceedance/non-exceedance information will be given from October through December, since lake freeze-up levels will be given in the fall outlooks previously issued.

ADDITIONAL INFORMATION...

The long-range probabilistic outlook is based on high and low lake levels that were calculated for the valid period using multiple
scenarios of temperature and precipitation from 1949 to 2018 and current conditions of the lake, snowcover (in winter), and soil moisture.

By providing the complete range of lake level probabilities, the amount of risk associated with long-range planning decisions can be determined. These probabilistic outlooks are part of NOAA's National Weather Service's Advanced Hydrologic Prediction Services (AHPS).

A YouTube video on "How to Interpret River Outlook Products" is at:
