Glasgow, MT

NEW Meteorologist In Charge at NWS Glasgow:

Effective August 28, Patrick Gilchrist has been promoted to Meteorologist-In-Charge at the National Weather Service in Glasgow, MT. He has served as Warning Coordination Meteorologist at Glasgow since 2016 and was a Lead Forecaster before that. We look forward to moving ahead as an office under his leadership as we all begin a new chapter together.

Join CoCoRaHS Today!

CoCoRaHS is a grassroots organization with a network of highly committed observers who report daily precipitation such as rain, hail, or snow from all across the country. The data are used by meteorologists, insurance adjusters, mosquito control, and even by those in academia.

Participating in the CoCoRaHS program is a great way to make a difference in your community. Check out the [CoCoRaHS main page](#) to learn more! We are still accepting new observers so feel free to join through the main CoCoRaHS website today. All you'll need is a ruler and a rain gage to get started!

Cold Season Season Training 2022: Coming Soon!

We'll soon be announcing the details of our cold season CoCoRaHS training for 2022, so be on the lookout for that! Meanwhile, [check out the training](#) we did for the warm season and then sign up to [join](#) via the CoCoRaHS website to get started as a new observer!

Percent of Normal Precipitation (Montana)

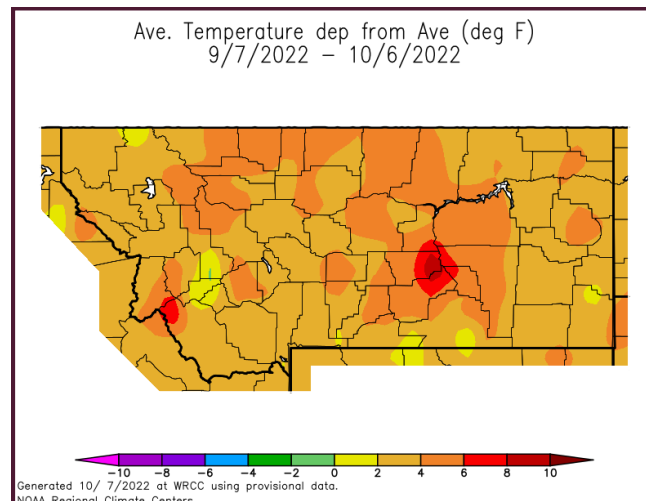

Figure 2: 30-day percent of normal precipitation across Montana.

Avg. Temp Departure from Normal (Montana)

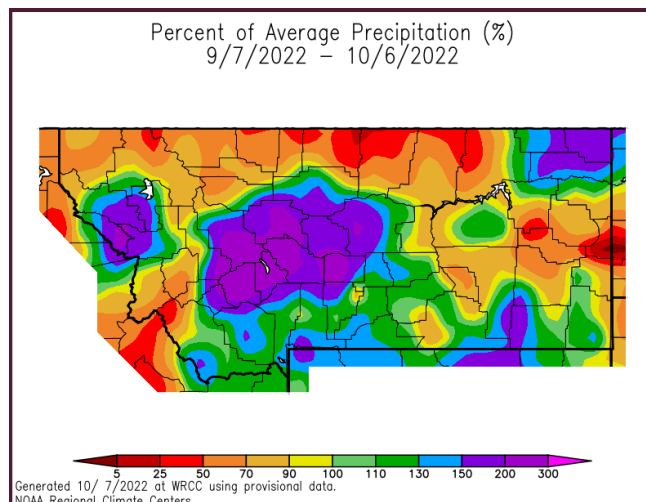

Figure 1: 30-day temperature anomalies across Montana.

Summary: The last 30 days brought warmer than normal temperatures across the state of Montana. Meanwhile, precipitation trends varied across the state. Far NE Montana and portions of southern and central Montana experienced wetter than normal conditions. On the other hand, much of northern Montana and southeast parts of the state saw below average precipitation.

Hydrologic Summary for September 2022, By Greg Forrester, Lead Forecaster at NWS Glasgow:

September was a warm and dry month over northeast Montana. Once again, most areas had less than 50 percent of their normal precipitation. The wet spots for the month were Winnett 6NNE with 0.87 inch, Mosby with 0.77 inch, and Port of Morgan and Wolf Point 29 ENE with 0.67 inch. The dry spots included Fort Peck with 0.05 inch, Cohagen 22SE and Hoyt with 0.06 inch, and Sidney airport with 0.10 inch. Glasgow received 0.13 inch which was 12 percent of normal. Temperatures varied from 4 to 8 degrees above normal across the region. Glasgow averaged 65.9 degrees which was 6.0 degrees above normal. It was Glasgow's warmest September on record beating 1998 which averaged 65.8 degrees. On September 7, several locations set all time record highs for the month of September.

The dry weather allowed for the drought to expand across northeast Montana. At the end of September, moderate to extreme drought covered the entire region.

The Milk River had near record low stream flow for the entire month. The Yellowstone, Poplar, and Missouri Rivers had below normal streamflow for the entire month.

The Fort Peck Reservoir elevation fell to 2219.7 feet during the month. The reservoir was at 64 percent of capacity and 81 percent of the mean pool.

CPC Outlook:

The Climate Prediction Center released its latest three month outlook for temperature and precipitation for October through December on September 15, 2022. The outlook shows equal chances for normal, below normal, or above normal temperatures for most of Montana. Warmer than normal conditions are favored only across far southwest portions of the state. Meanwhile, above normal precipitation chances favored across the Pacific Northwest extending into western Montana. Equal chances of normal, below normal, or above normal precipitation across eastern Montana exist according to the outlook. Looking ahead to winter, while the official winter outlook hasn't been released just yet, we can say that odds favor La Niña will be present. This generally will mean cooler and wetter conditions across the region. That said, patterns can still fluctuate from year to year and there certainly have been seasons that have gone against an expected trend.

The latest outlook is always available [here](#). In addition, you can check out the Climate Prediction Center [Interactive site](#)! You can zoom in on our area, and navigate to see the climate outlook for your specific location.

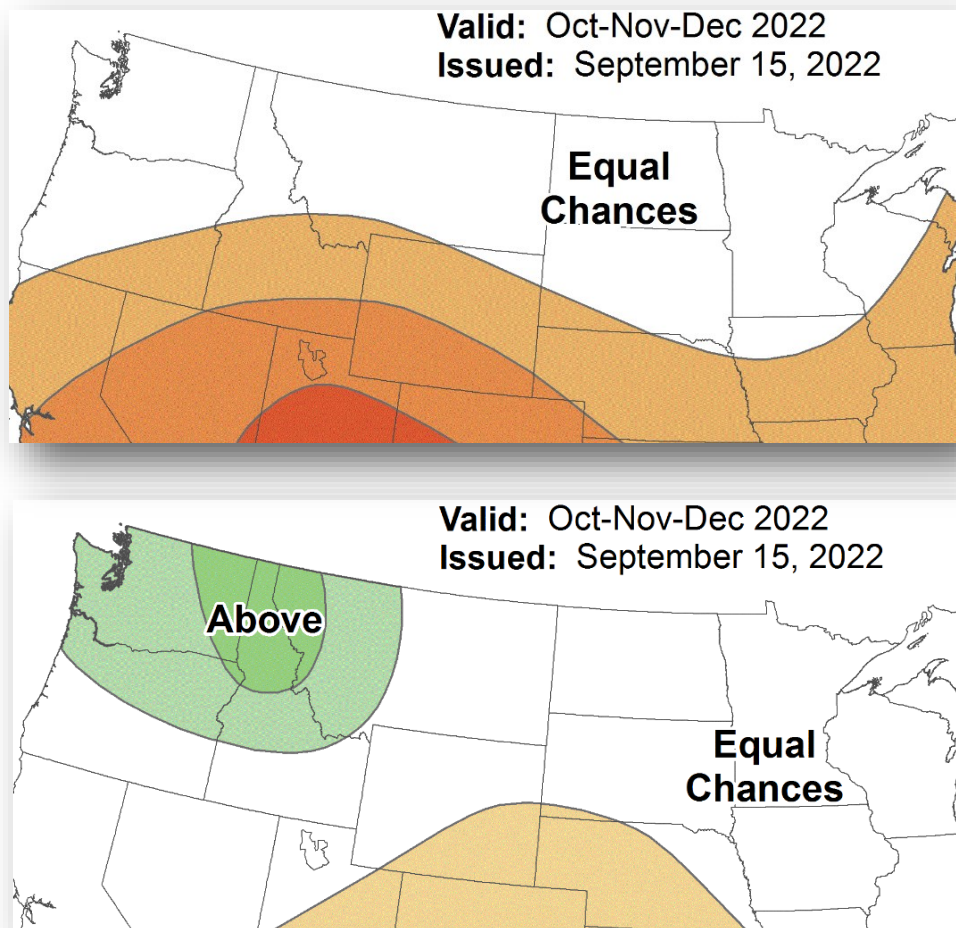

Figure 2: Climate Prediction Center three month outlook (October to December 2022) for temperature (top) and precipitation (bottom).

U.S. Drought Monitor:

The latest U.S. Drought Monitor was released on Thursday October 13, 2022. The drought persists across much of Montana. Severe to extreme drought conditions continue to be commonplace over much of North Central and Northeast Montana as of the latest update. This outlook is updated each Thursday. Please feel free to check out the latest [here](#).

U.S. & Global Climate Highlights (August): The [U.S.](#) & [Global](#) climate highlights for August 2022 have been released, the latest month for which data was available. A few points for you to take home are provided below.

U.S. Selected Significant Climate Anomalies and Events for August and Summer 2022

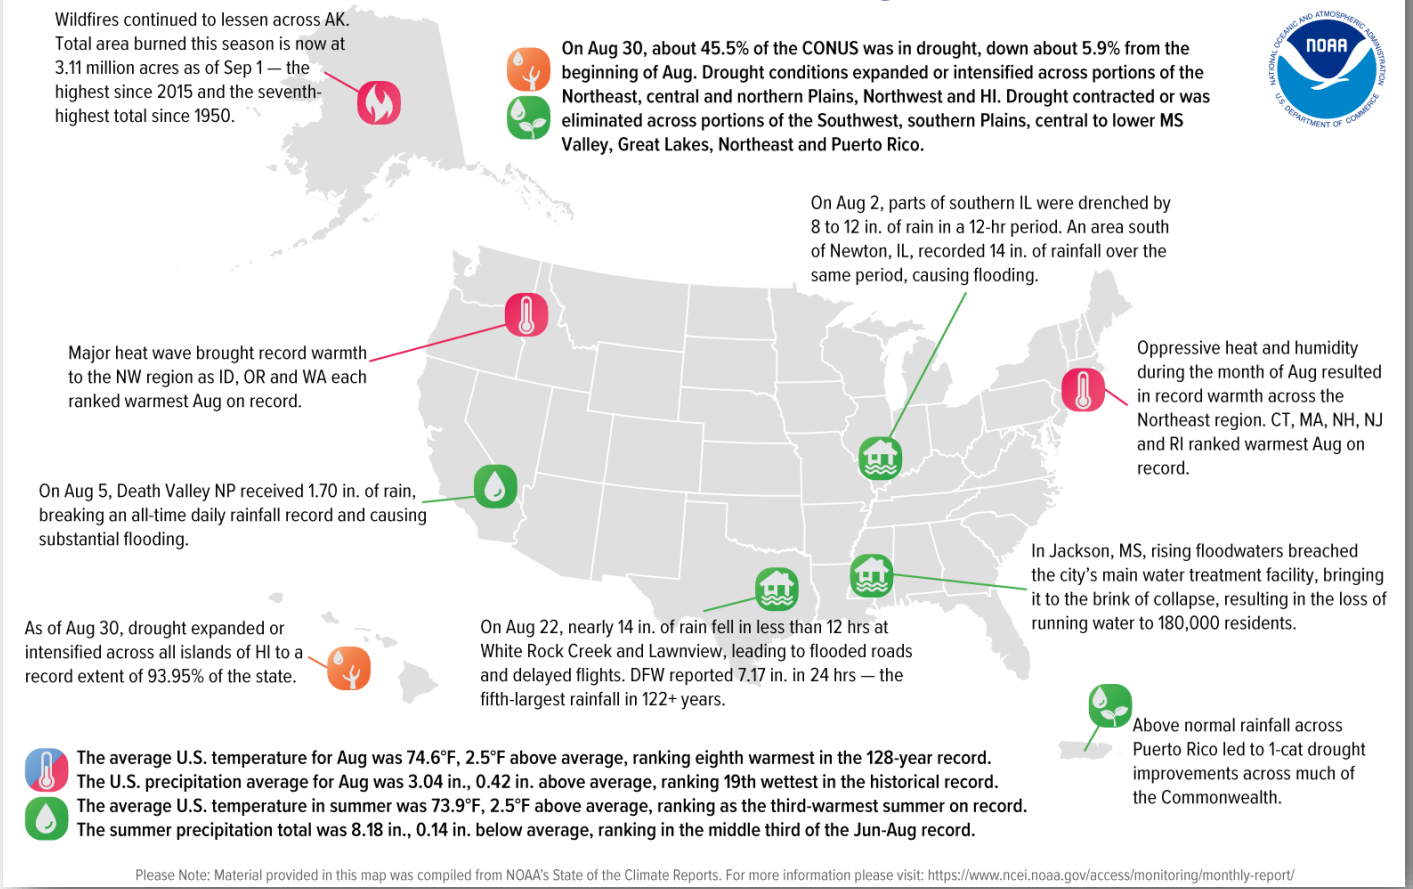

Figure 4: Significant Climate anomalies and events in August 2022

U.S. Highlights for August 2022

- 1) The contiguous U.S. average temperature for August 2022 was 74.6 °F, ranking 8rd warmest on record.
- 2) The average August precipitation total for the contiguous U.S. came in at 3.04 inches, ranking as the 19th wettest on record.

Global Highlights for August 2022

- 1) The August 2022 global surface temperature anomaly came in as the 6th highest for August on record.
- 2) Interestingly, as much as 8.2% of the world's surface experienced a record high temperature in August, and this is the third highest July percentage on record.
- 3) Precipitation anomalies varied considerably around the world in May 2022, which is fairly typical.

Winter Weather Safety

- ◆ Winter often comes early in NE Montana. That means sub-freezing temperatures and frozen precipitation may soon be on the way. The National Weather Service is ready to help keep you safe all season long. Check out our [winter safety page](#) to learn more.

Monthly Trivia:

Last time we asked...

Several of you may have seen our recent aurora which was visible across portions of NE Montana on Saturday September 3rd. Our question this month, what causes the aurora borealis?

Answer: The [Space Weather Prediction Center](#) provides [detailed information](#) on the Aurora Borealis (Northern Lights) as well as [viewing tips](#), and a 30 minute forecast. In short, the Northern Lights occur due to negatively charged particles called electrons colliding with the upper atmosphere. Electrons follow the magnetic field down to the Poles (North and South Pole). Here, they interact with oxygen and nitrogen atoms in the upper atmosphere. These collisions excite the molecules in the upper atmosphere, but when that state is lowered, energy is released in the form of light. The process that occurs is similar to how a neon light operates.

Figure 6: Photo of the Aurora (Northern Lights) taken by Angel Enriquez, meteorologist at the NWS Glasgow office.

 **New Question:** October often means the first snow is right around the corner for much of NE Montana, which brings us to this month's trivia question. What is the earliest measurable first snowfall on record for Glasgow, MT?
