After a relatively benign active weather month in October, November 2002 also started slow for Interior Central California. However, the first major trough off from the East Pacific combined with tropical moisture from Hurricane Huko at southern latitudes brought copious amounts of rain (snow levels at or above 9,000 feet Mean Sea Level) and gusty wind at higher elevations from the 7th until early on the 9th. What was unusual for this area was the change from the normal summer/fall dry conditions to the wet season in such dramatic fashion with little in the way of transition. During the period in the Southern Sierra Nevada 46" of new snow fell at Volcanic Knob and Upper Burnt Corral; and in the Tulare County Mountains 80" fell at Chagoopa Plateau. Numerous foothill locations received 5-10" of rain within the 3-day period in the foothills of the Southern Sierra Nevada. Johnsondale, in Tulare County received 16.38" of rain in the 3-day period. On the San Joaquin Valley floor Merced received 1.80" in 3 days, Fresno 1.76"; Hanford 1.44"; and, Bakersfield 1.29." Rainfall amounts for the 8th were over 1" at several Valley locations thereby establishing new 24-hour rainfall records, e.g. Fresno's old record for the 8th was 0.23" ... new record 0.98". There were 23 pole fires caused by wind and arcing reported by Southern California Edison utility and ultimately affected 102,000 residents in the Central and Southern S.J. Valley.
