

NATIONAL AVIATION METEOROLOGISTS

Air Traffic Control System Command Center

Impact-Based Decision Support Services for the National Airspace System

FEB 24, 2023

Joe (Joey) Carr
National Aviation Meteorologist

BACKGROUND

Born in NOLA - grew up in Metairie, LA

1987 – Graduated Riverdale High School right across the river

1987-1989 – Attended University of New Orleans

1989-1991 – Graduated Florida State University

Summer 1990 ... NWSFO New Orleans (Slidell) - Summer Intern

Mar 1992 – Mar 1995 ... NWSFO Raleigh-Durham - Intern/Fire Weather Forecaster

**Mar 1995 – Oct 2004 ... WPC (Weather Prediction Center) Formerly HPC (Hydro-meteorological Prediction Center)
- Development and Training Meteorologist**

Oct 2004 – July 2014 ... NCEP Central Operations (NCO)
- Senior Operations Specialist (Supercomputer Operations)
- Senior Duty Meteorologist
- Senior Duty Meteorologist Team Lead
- Production Management Team Lead
- Dataflow Team Lead
- Senior Duty Meteorologist Team Lead

July 2014 – Current ... Aviation Weather Center (AWC) - National Aviation Meteorologist (NAM)

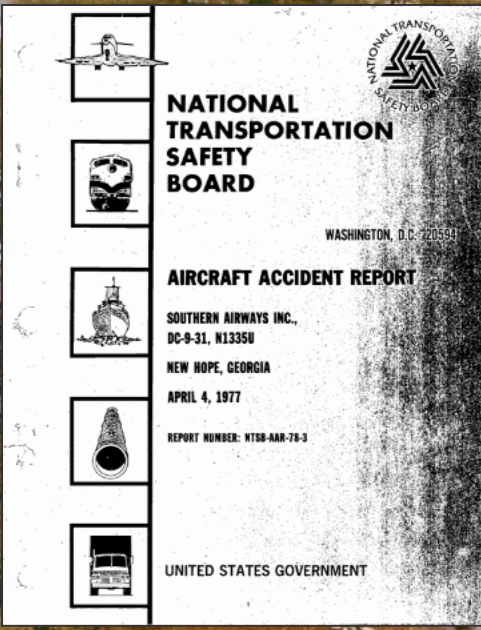

NATIONAL AVIATION METEOROLOGISTS

Air Traffic Control System Command Center

February 26, 2023 // 2

Why Are Meteorologists at CWSU's?

Source: NTSB

NATIONAL TRANSPORTATION SAFETY BOARD
WASHINGTON, D.C. 22054

AIRCRAFT ACCIDENT REPORT

SOUTHERN AIRWAYS INC.,
DC-9-31, N1335U
NEW HOPE, GEORGIA
APRIL 4, 1977
REPORT NUMBER: NTSB-AAR-78-3

UNITED STATES GOVERNMENT

Southern Airways Flight 242 crash in New Hope, GA on April 4, 1977...72 souls lost (22 on-board survived)

Total loss of thrust from both engines due to damage from ingest of water/hail while penetrating an area of severe thunderstorms

NTSB recommendation A-77-068 to formulate procedures for the timely dissemination of all available severe weather information by controllers

One year later (1978) FAA had 3 NWS meteorologists in 13 ARTCCs;
August 1981 - FAA had 4 NWS meteorologists in all 21 ARTCCs
Partnership continues to this day!

NATIONAL AVIATION METEOROLOGISTS

Air Traffic Control System Command Center

February 26, 2023 // 3

Brief History of the NAMs

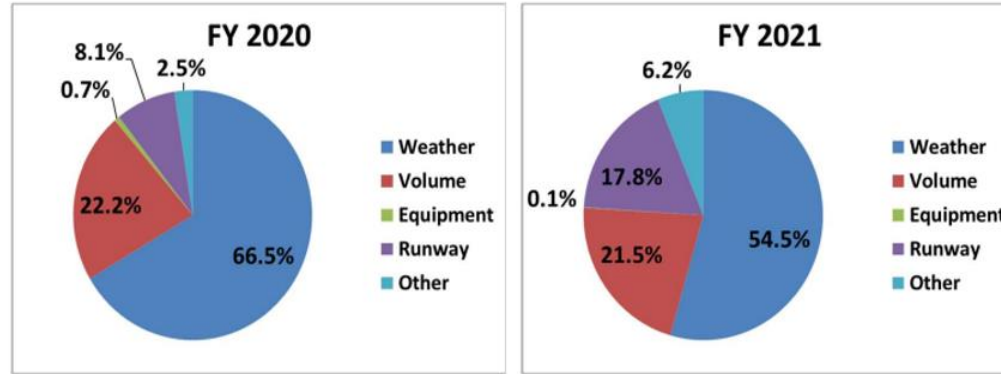

- Pre-1995
 - NWS Meteorologists at ATCSCC
- Post-1995
 - FAA Weather Specialists at ATCSCC
- May 2012
 - NWS Returned to ATCSCC (2 Meteorologists)
- August 2014
 - 1 Meteorologist & 1 Manager Added
- July 2016
 - 2 Meteorologists Added
- January 2019
 - Last FAA Specialist Retires
- **NOW**
 - 1 Manager (Vacant) (Meteorologist), 5 Meteorologists

Causes of National Airspace System Delays

Delays by Category

The two charts below show the sources of delays at Core 30 airports by type of delay.

Note: System impact delays are delays assigned to causal facilities in OPSNET and are composed of delays due to TMIs, departure delays, and airborne delays. System impact delays are also the basis for delays by class and delays by cause in OPSNET. (<http://aspmhelp.faa.gov/index.php/OPSNET> Reports: Definitions of Variables)

Source: Federal Aviation Administration, Air Traffic Organization, Office of Performance Analysis (AJR-G), Operations Network (OPSNET), March 7, 2022.

As much as 67% of the delay in the NAS can be attributed to weather, resulting in US economic losses of roughly **23,000,000,000 USD annually.**

NATIONAL AVIATION METEOROLOGISTS

Multi-Million Dollar Losses to Aviation

18,411 Cancellations

1/22-1/25 2016 – Winter Storm and Thunderstorms

~\$8K Loss / Flight
(variable per flight/aircraft type)

~\$150M Losses

Cancellations ✈ Mostly due to Snow/Ice
Divers ✈ Mostly due to TS/CIGs/VSBY
Delays ✈ Mostly due to TS/CIGs/VSBY

211,226 Min of Delay

8/20/15 - Thunderstorms

~\$74 Loss / Minute

AM & PM TS
EWR, LGA,
JFK & PHL
(Routes
Blocked)

AM TS
IAH ↔ DFW
(Routes Blocked
& TS at
Terminal)

~\$16M Losses

322 Diversions

6/15/15 Thunderstorms

~\$8K Loss / Flight
(variable per flight/aircraft type)

TS Impacting:
ORD – NY/PHL/DC
ORD – DFW
DFW – IAH

~\$2.6M Losses

Types of Losses

Airline Crew (timeout)
Missed connection
Missed meeting/vacation
Hotel (airline/passengers)
Reimbursing Tickets
Food
Taxis
Rental Cars
Fuel (airlines & passengers)
Maintenance (airlines)
Lost demand (passenger uses other means)
GDP reduced
Tarmac rule (> 3 hours)
\$27,500 per passenger (paid to Trans Dept)

**Some airlines
build divert
costs into
budgets*

This is Our Mission

AWC Mission

The Aviation Weather Center's highly skilled people deliver global operational aviation weather products and services essential to safe and efficient flight, and economic well-being.

NAM Mission

Ensure the safe and efficient operation of the National Airspace System through the provision of timely, relevant, accurate and consistent environmental information to decision makers.

Key Aviation Stakeholders

Federal Aviation
Administration
(FAA)

National
Transportation
Safety Board (NTSB)

Airlines For America
(A4A)

International Air
Transportation
Association (IATA)

National Business
Aviation Association
(NBAA)

General Aviation
Community

Aircraft Owner and
Pilot Association
(AOPA)

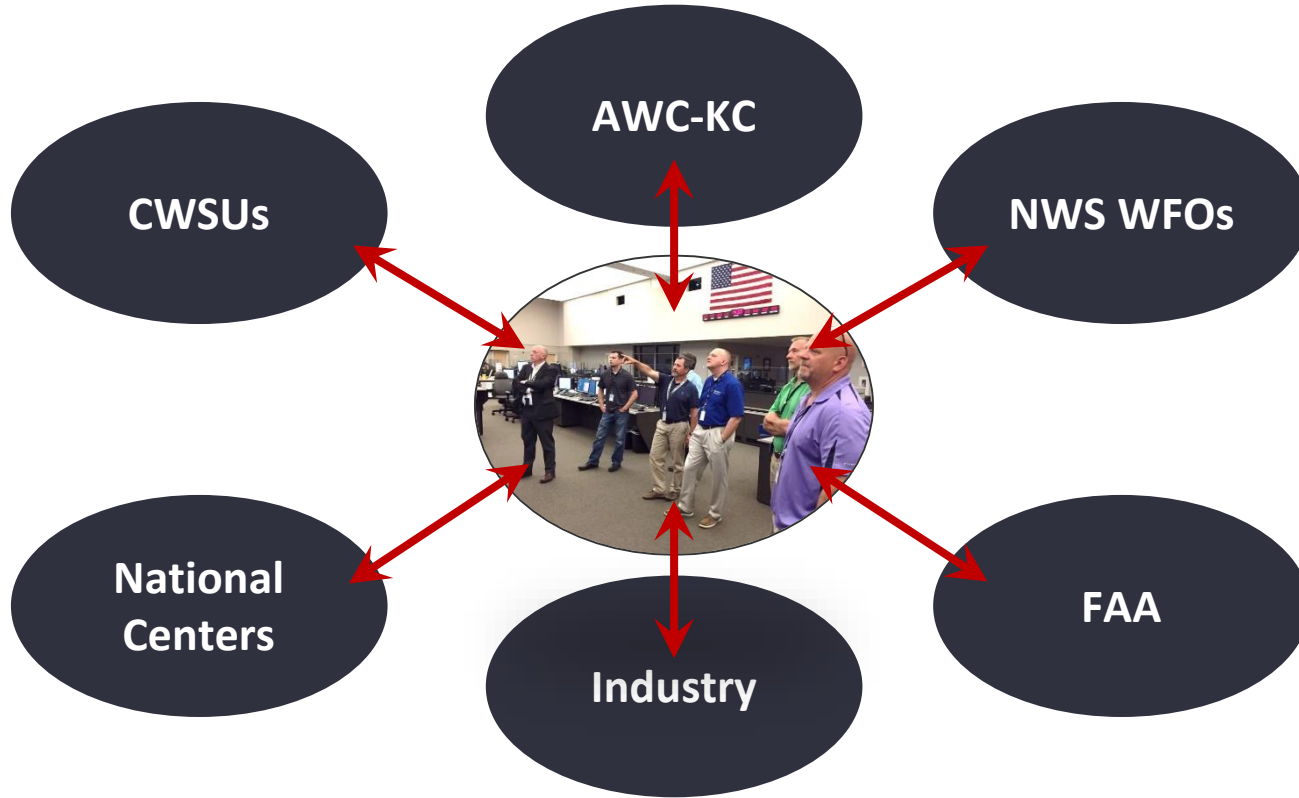

International
Meteorological
Service Providers

International Civil
Aviation Organization
(ICAO)

Coordination and Collaboration

NWS Support to ATCSCC

Improve safety, efficiency, and decision making for the National Airspace System

Support Collaborative Decision Making

Balance air traffic demand with system capacity

Fully Integrated and Embedded IDSS

Collaborative Forecast Process (NWS and Industry)

Focus on weather with potential system impact

Our goal is to paint a cohesive national weather picture to the Command Center to improve safety, efficiency, and decision making.

Impact-Based Decision Support Services

“Information is cheap. Meaning is expensive.”

- George Dyson, Science/Technology Historian

Weather information is voluminous. This can lead to “paralysis by analysis.”

Experience, training, interpretation and insight

= keys to aiding in smart, safe, & effective decision making!

“We don’t care where your forecasts are correct or have the highest confidence ... tell us where you could be wrong ... because that is where all the planes are going” – Retired FAA Controller

“NAM forecasters are meteorologists, but more importantly, we are risk managers who assess weather risk and communicate that risk in a manner which allows users to make decisions.”

Impact-Based Decision Support Services

Decision support includes, but not limited to:

- *Real-time assessments of current & forecast weather*
- *Collaboration with NWS and airline meteorologists*
- *Planning outlooks out to 4 days – including PERTI*
- *Post-event forecast reviews and debriefings*
- *Meteorological insight supporting traffic management initiatives*
- *And much, much more...*

Daily Products and Briefings

- Customized TAF Updates: 05, 07, 09, 11, 13, 15, 17, 19, 21 (Local)
- TCF Collaboration – 06, 0730, 10, 12, 14, 1530, 18, 20 (Local) (March - October)
- 4-Day Terminal Outlook – 0730 Local
- NWS HQ Standup Briefing – 0745 Local
- ATCSCC Standup Briefing – 0800 and 1600 Local
- Caribbean/Snowbird Outlook - 0815 (Apr-Oct, Fri; Nov-Mar, Fri-Sun)
- AWO Update #1 – 0830 Local
- NAS Weather Outlook Graphics (up to Day 8) – 0930 Local
- TCF Daily Review on NSR – 1000 Local (Mon-Fri)
- SysOps Director VTC (8-Day Outlook) –1030 Local (Tue)
- PERTI Outlook – 1030 Local
- PERTI Webinar Pre-Brief – 1300 Local
- PERTI Planning Webinar – 1430 Local
- AWO Update #2 – 1530 Local
- Day 2 NAS Weather Outlook Update (PERTI) – 2015 Local (Mon-Fri)
- Scheduled and Ad-hoc ATCSCC briefings: ~15 to 20 per day
- Space Weather (SWPC), Ozone & Volcanic Ash -- as needed
- Ad-hoc Telecon Briefings/NWS Chat for coordination/collaboration
- Special weather packages ... Winter Weather, Tropical systems, 5G ... etc

COMPRESSION OUTLOOKS - ZNY

COMPRESSION ... WHAT IS IT? UNFAVORABLE WIND AT MULTIPLE VERTICAL HEIGHTS LEADS TO A STACKING OF AIRCRAFT ATTEMPTING TO LAND.

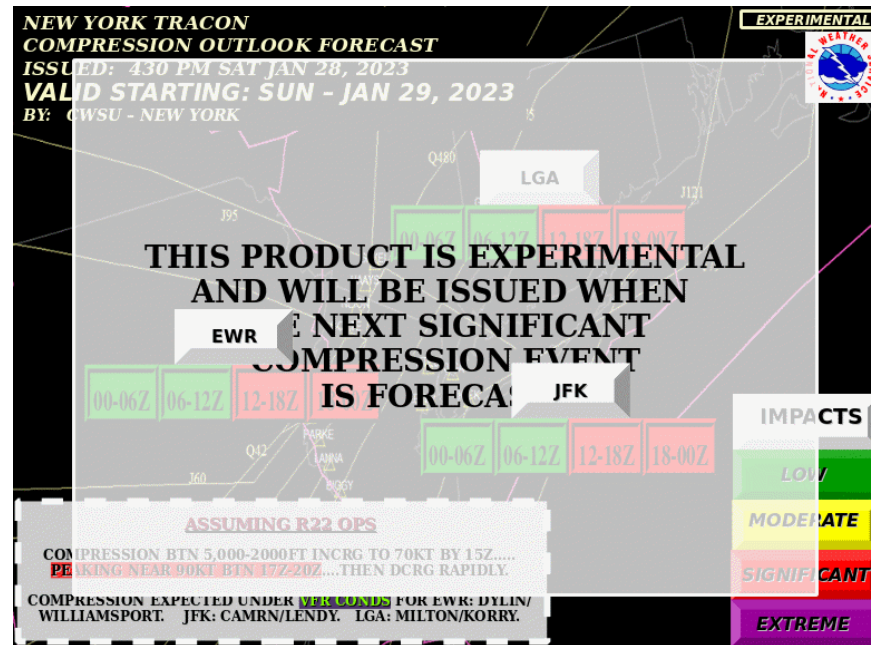

CONFIGURATION DEPENDENT – NOT LLWS

EXAMPLE:

- 75 KT TAIL WIND (SOUTHWESTERLY AT FL030)
- 15 KT HEAD WIND (SOUTHWESTERLY AT SFC)
- RESULTS IN 90 KT OF COMPRESSION
- DESCENDING AIRCRAFT FORWARD SPEED ACCELERATES WITH TAIL WIND ... THEN THEY FACE AN ABRUPT HEAD WIND RESULTING IN DECELERATION.

RESULT:

- CONTROLLERS MUST ALLOW FOR ADDITIONAL SPACING BETWEEN AIRCRAFT ... **DELAYS!!**

QC Assessments – On Demand/As Needed - Let's look back

How did we do?

Seattle Low IMC Fog Event - 11/20/18

Overview: A period of low instrument meteorological conditions occurred at Sea-Tac International Airport from approximately 1050Z to 1830Z on Tuesday, November 20, 2018. During this period, ceilings lowered to 100ft AGL with an indefinite ceiling reported for up to an hour at times. Visibility was reduced to less than 1/2 mile with periods of Runway Visual Range as low as 300ft. A brief period of improvement occurred between 1348-1435Z, with visibility 4SM and no ceiling, however, IMC conditions returned and persisted until the end of the period.

Forecast: Discussion Monday emphasized continued high pressure in place across the region, with patchy fog likely overnight Monday into early Tuesday morning, and areas of IMC fog possible. Near surface moisture, with dry/stable air above it, was forecast, with light southerly winds aloft. This supported conditions favorable for radiation fog development, particularly near moisture sources and valleys, but typically not widespread or long duration.

Forecast confidence in a LIMC fog event increased Monday evening, as lowland fog began to develop earlier than anticipated. DCC weather, NWS and DAL all began forecasting a low or very low IMC fog at Sea-Tac early Tuesday morning, with a larger coverage area.

Northeast Winter Storm – 11/15/18

Overview: Low pressure developing along the southeastern U.S. coast moved north into the Mid-Atlantic and northeastern U.S. A variety of precipitation occurred with mostly snow inland and a mixture of snow, sleet, freezing rain and rain along and east of the I-95 corridor.

Model forecasts, from November 13th 14th, were mostly favoring the rain/snow line moving west of the I-95 corridor Thursday morning in the DC area, with IAD and NRO airports turning over to rain during the afternoon. The rain/snow line moved westward much slower than anticipated, and resulted in a more lengthy period of heavier snow and sleet than originally forecast.

Older TAFs were used, due to the fact that they were based on the 00z model guidance. Early morning decisions were being made on the overnight TAFs. After 12z the TAFs were frequently amended to better fit the ongoing weather situation(s) at the individual airports.

Verification: The High Resolution Rapid Refresh model (HRRR) seemed to resolve the rain/snow line position and movement much better than other guidance for this event in the DC to Phil corridor. The HRRR was too quick with the change to rain from Phil to NRO.

Images included:

- 24 hour snow/ice accumulation analysis
- 11/15/18 - 00z HRRR (High Resolution Rapid Refresh) forecasts of precipitation type valid 12z, 15z, 18z, 21z & 00z

Key Data included:

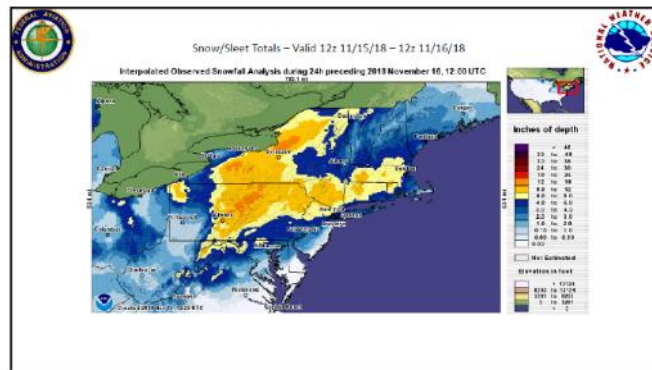

- 06Z NWS TAFs for DCA, IAD, RWL, PHL, EWR, LGA & JFK
- 06Z DAL TAFs for DCA, LGA & JFK
- 06Z LAL TAFs for IAD & EWR
- 07Z DAL TAF for DCA, PHL & JFK
- Key METARs for DCA, IAD, BWL, PHL, EWR, LGA & JFK

Significant Event Updates – Winter Weather Event

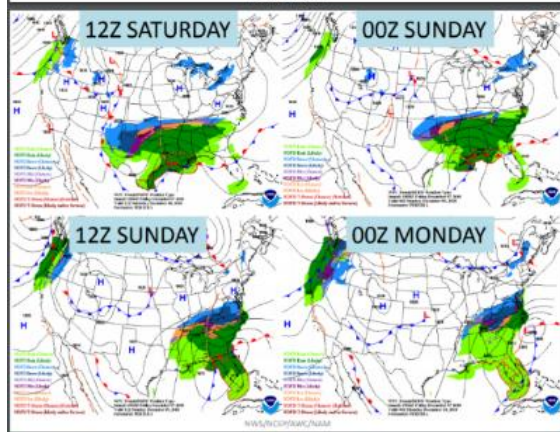

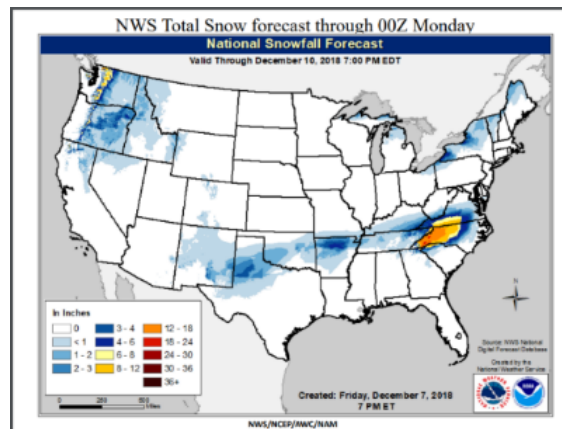

Southern U.S. Winter Storm
12/8/18 - 12/10/18
Issued 00Z SAT 12/8/18

Summary:

- Low pressure will develop tonight over southeast Texas and move east-northeast off the North Carolina coast by 00Z Monday. Winter precipitation will spread east from Texas/Oklahoma tonight across portions of Arkansas, Missouri, Kentucky on Saturday and across North Carolina and southern Virginia on Sunday.
- Significant accumulations of snow and sleet are likely across portions of northern Texas, northern Arkansas, Tennessee, Kentucky, North Carolina and Southern Virginia. Significant icing (freezing rain) is possible across upstate South Carolina, northeast Georgia and portions of North Carolina.
- The only major terminal with potential significant impacts at this time is Charlotte North Carolina.

NWS/NCEP/MHC/NAM

JATOC/J-CAT Support

What is the JATOC Crisis Action Team?

- Part of the Joint Air Traffic Operations Command's (JATOC) Incident Command System
- NAMs provide support during J-CAT activation similar to NWS support to State/Federal Emergency Operations Centers
- Activation triggered by a wide spectrum of events, from civil unrest to natural disasters
- Routine support to ATO Watch Officer (AWO) continues when J-CAT not active (Twice per day updates)

Agenda Item 1 | Weather Update (NWS)

At 06Z AMST (0600UTC), the center of Tropical Storm Michael was located near latitude 20.5 N, longitude 80.5 W, about 100 miles from the north end of the Yucatan Peninsula. Michael is moving west-northwest at 20 mph (33 km/h) and has a maximum sustained wind of 35 mph (56 km/h). It is expected to continue to strengthen and move toward the Gulf of Mexico. A storm surge of 3 to 5 feet is possible along the coast. A storm surge of 3 to 5 feet is possible along the coast. A storm surge of 3 to 5 feet is possible along the coast.

Severe Weather Avoidance Plan (SWAP)

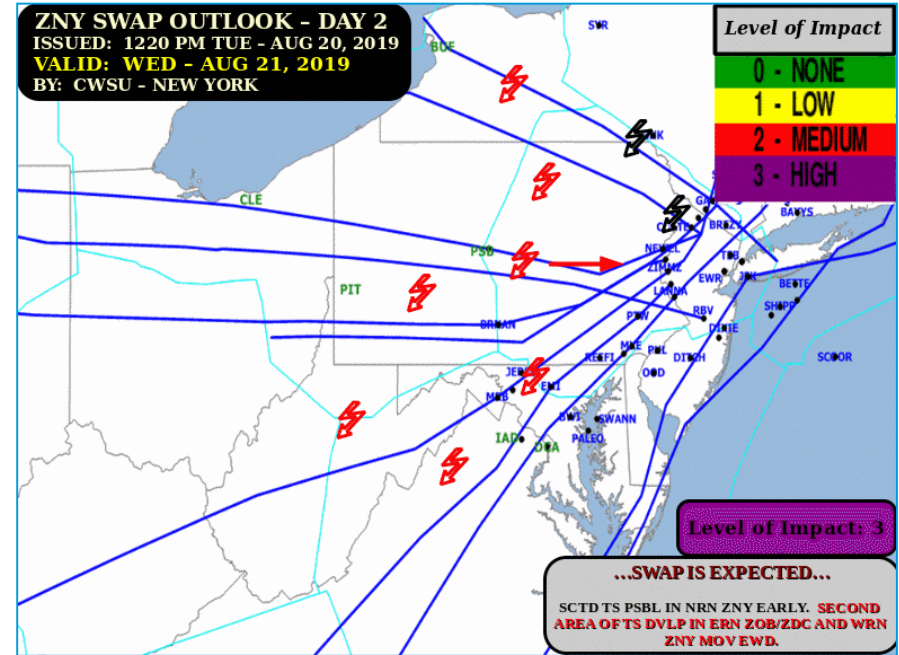

- A formalized program developed for areas susceptible to disruption in air traffic flow due to thunderstorms (provides the least disruption to the NAS)
Note: This is not the same definition the NWS uses for severe weather
- Each facility (ARTCC) develops its own strategy for managing severe weather events (some develop joint plans with adjacent facilities) and alternatives to minimize/mitigate airspace impacts
- Facility plans (SWAP statements) are delivered to the ATCSCC and may become part of the daily NAS Operations Plan (SWAP advisories)
- Responses are tailored to meet forecast/actual weather events: Planned Routes (open/closing highways) , Control Air Flow space by limiting the number of aircraft over a given time in a defined region

SWAP Outlook (ZNY/ZDC)

February 26, 2023 // 37

Traffic Flow Management Convective Forecast (TCF)

Collaborated forecast issued every 2 hours, 24/7

Forecast lead times of 4, 6, and 8 hours

High Confidence areas only...Does **NOT** account for lightning

Available on internal FAA systems and web (www.aviationweather.gov/tcf)

- Areal coverage $\geq 25\%$ sparse, $>40\%$ medium
- Linear coverage $\geq 75\%$, $\geq 100\text{NM}$
- $\geq 40\text{dBz}$ Reflectivity
- Echo Tops $\geq \text{FL250}$

First Issuance: 1 March 0230 EST

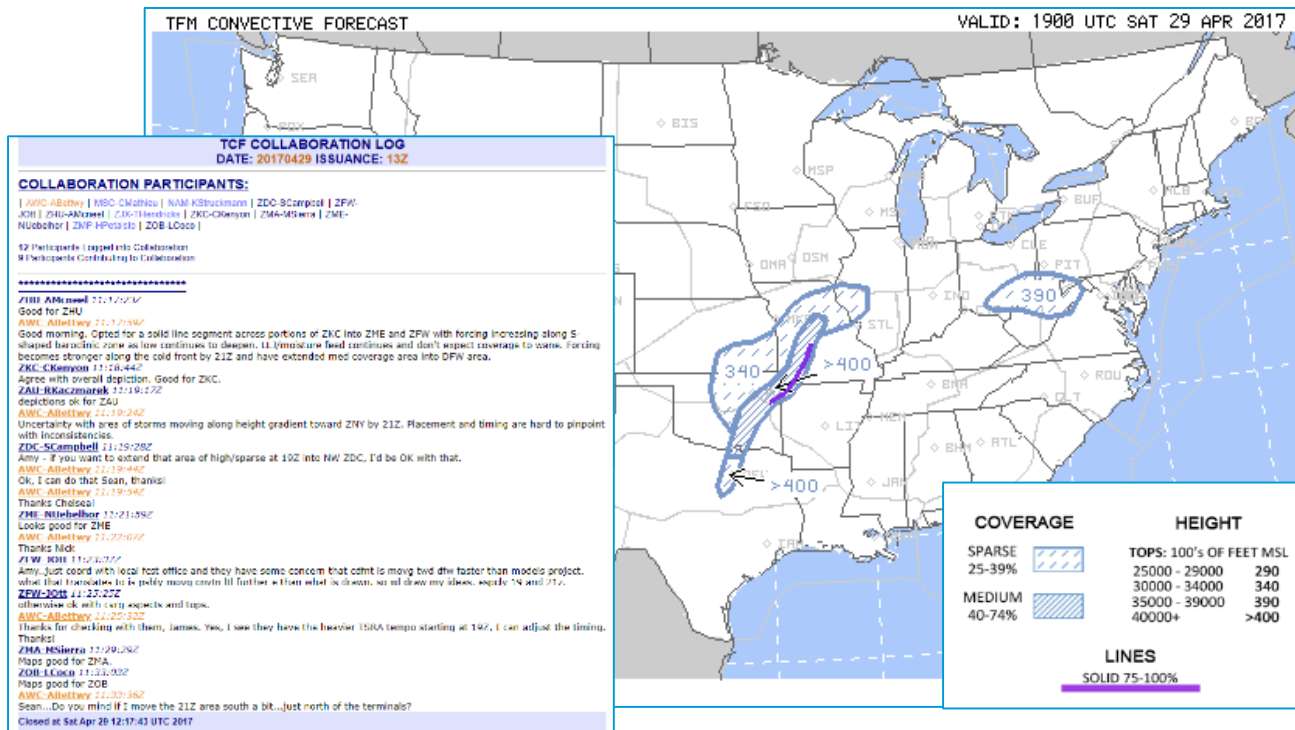

Last Issuance: 31 October 1830 EDT

(Southern Ontario/Quebec: 1 Apr-30 Sep)

*Automated TCF continues Nov-Feb

Traffic Flow Management Convective Forecast (TCF)

Collaboration is vital! TCF is the primary convective guidance for the FAA to determine Traffic Management Initiatives.

NATIONAL AVIATION METEOROLOGISTS

Air Traffic Control System Command Center

TCF Coverage Example

TCF Echo Top Forecast

Does not represent maximum echo top height!

Represents the highest tops with coverage
at least 25% within the polygon...
some tops could be higher.

NATIONAL AVIATION METEOROLOGISTS

Air Traffic Control System Command Center

February 26, 2023 // 41

TCF Echo Top Forecast

Start at highest tops and work down

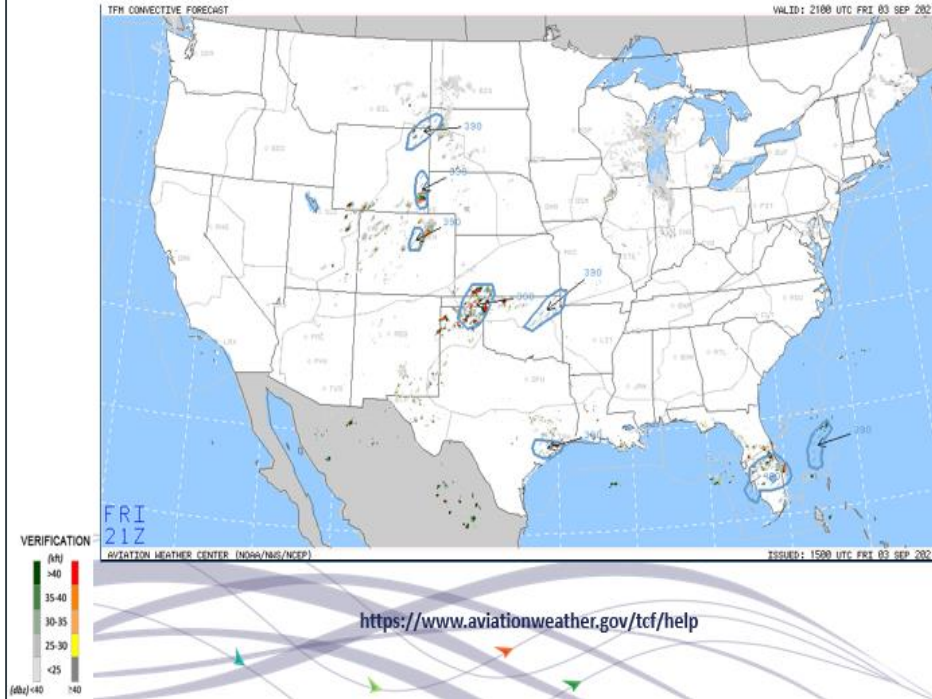

What is the first instance of $\geq 25\%$ total area?

Echo tops forecast is 340

Per FAA feedback, **FL320** is a critical level for operations.
Focus is given to this threshold while forecasting tops during the collaborative sessions.

TCF Verification and Daily Review

◀ Fri Sep 3 2021

- Verified Well
 - ZMA (FL)
 - ZKC (OK/TX Panhandle)
- Verified Close
 - ZHU
 - ZDV

AWC Social Media (Facebook & Twitter)

“First, it should be understood that forecasts possess no intrinsic value. They acquire value through their ability to influence the decisions made by users of the forecast.”

- Allan H. Murphy, Weather and Forecasting (June 1993)

“Weather is intertwined with nearly every decision we make.”

- Bryan Beck, ATCSCC National Operations Manager

Numerical Weather Prediction

NATIONAL AVIATION METEOROLOGISTS

Air Traffic Control System Command Center

February 26, 2023 // 52

There Are Many Weather Models

US

- GFS/GEFS
- NAM (3, 12, 36 km)
- RAP
- HRRR & HRRR-X
- WRF - ARW
- WRF - NMM
- NSSL - WRF
- LAMP/LAMP-X
- SREF

Others

- ECMWF
- UKMET
- CMC
- RGEM
- NOGAPS
- NAVGEM
- JMA

Numerical Weather Prediction

- Gives snapshots and/or animations of future state of atmosphere
- Requires **significant experience / training** to correctly interpret model output
 - Scientific basis / knowledge of how models work
 - Systematic biases, strengths, weaknesses
 - Comparison with current weather to cross-check initialization
 - “Reasonableness” (smell-test)
 - $Dprog/Dt$: i.e. trends
- There are dozens of models out there...which one is the right one?

Deterministic vs. Probabilistic

- Probabilistic - establishes a likelihood for a particular event
- Benefits to Probabilistic approach – many scenarios are considered, and the **“most likely”** solution is presented

“Primitive” Weather Forecasting Equations

$$p = \rho R T \quad \text{Ideal Gas Law (Equation of State)}$$

$$\vec{a}_h = \sum \left(\frac{\vec{F}_h}{m} \right) \quad \text{Newton's Second Law of Motion} \quad \Delta p = -\rho g \Delta z$$

$$\vec{a}_v = \sum \left(\frac{\vec{F}_v}{m} \right) = (\vec{P} \vec{G} \vec{A})_v - \vec{g}$$

Hydrostatic Law (Obtained from the Equation of Vertical Motion)

$$\Delta T = \Delta q / c_p + (1/\rho) \Delta p \quad \text{First Law of Thermodynamics}$$

$$(1/\rho) \Delta p / \Delta t = -D \nabla$$

Conservation of Mass Applied to the Atmosphere (Equation of Continuity)

$$\frac{\partial T}{\partial t} + u \frac{\partial T}{\partial x} + v \frac{\partial T}{\partial y} + w \left(\frac{\partial T}{\partial p} + \frac{RT}{p c_p} \right) = \frac{J}{c_p}$$

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial p} = 0 \quad 0 = -\frac{\partial \phi}{\partial p} - \frac{RT}{p}$$

Zonal wind: $\frac{\partial u}{\partial t} = \eta v - \frac{\partial \Phi}{\partial x} - c_p \theta \frac{\partial \pi}{\partial x} - z \frac{\partial u}{\partial x} - \frac{\partial (u^2 + v^2)}{\partial x}$

Meridional wind: $\frac{\partial v}{\partial t} = -\eta u - \frac{\partial \Phi}{\partial y} - c_p \theta \frac{\partial \pi}{\partial y} - z \frac{\partial v}{\partial y} - \frac{\partial (u^2 + v^2)}{\partial y}$

Temperature: $\frac{\partial T}{\partial t} = \frac{\partial T}{\partial x} + u \frac{\partial T}{\partial x} + v \frac{\partial T}{\partial y} + w \frac{\partial T}{\partial z}$

Precipitable water: $\frac{\partial W}{\partial t} = u \frac{\partial W}{\partial x} + v \frac{\partial W}{\partial y} + w \frac{\partial W}{\partial z}$

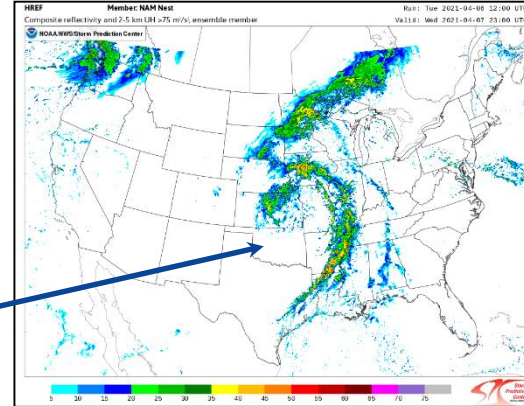

Pressure thickness: $\frac{\partial \partial p}{\partial t} = u \frac{\partial \partial p}{\partial x} + v \frac{\partial \partial p}{\partial y} + w \frac{\partial \partial p}{\partial z} + \frac{\partial \partial p}{\partial z} \frac{\partial p}{\partial t}$

- Deterministic - every event is the result of known inputs
(Ex: predicting a bank account balance...you know the initial deposit and the interest rate)
- In weather, there can be hundreds of inputs!
- Benefits to deterministic models – **one solution!**
- Drawbacks – that one solution probably isn't correct!

Deterministic vs. Probabilistic

HRRR/NAM/WRF/NMM
and most Global models
are deterministic

Forecast Reflectivity
(snapshot of what
the radar is expected
to look like)

SREF, HREF, and LAMP
are Probabilistic

TSRA Probability
(areas most likely to
see convection)
