Texas Rolling Plains in Janua	ıry 2009.				
•	rly fall of 2008, precipitation was scarce ov 2009. Severe (D2) drought developed over t		-		

November-December-January-February-March-April time frame remain at only 30% to 40% of climatic averages. The U.S. Drought Monitor, however, indicated an expanding area of intensifying extreme (D3) drought over western north Texas at the end of the month, just east of the Rolling Plains region.

Area grasslands were very dry during early April, and the ambient fire danger was extreme. A series of high wind events contributed to a few episodes of widespread wildfire activity across the Southern Plains during the first week of April. At least four significant wildfires developed over the local area on the 2nd and 4th. These fires destroyed one home and damaged oil field equipment. Increased rainfall and warming overnight temperatures, however, contributed to green-up and a decrease in ambient fire danger by mid April.

Following the failure of winter wheat crops in previous months, agricultural impacts were relatively minimal in April. Conditions precluded the planting of some cool season crops including winter wheat. Local cotton experts remain optimistic that soil moisture profiles remain favorable following the September-early October rains, but suggest that normal springtime rainfalls will be critical to the success of the upcoming season's cotton crops.

State agricultural officials estimate that cattle losses related to the drought will exceed \$1 billion. Only a fraction of those losses occurred in the South Plains region with most of the land usage locally being for cotton production.

The total economic impact across the South Plains region in April was estimated at \$3 million, with approximately \$18 million dollars of economic loss occurring locally since the onset of severe (D2) drought conditions in January 2009.

A very dynamic upper air storm system dug southward over the plains of eastern New Mexico and then ejected eastward over the South Plains of west Texas during the late hours of the 1st and early morning hours of the 2nd. This system produced a variety of weather hazards over the South Plains, with widespread high winds being the primary impact.

Severe gusts up to 67 mph were measured by the Texas Tech University West Texas Mesonet at many locations across the South Plains, both in advance of a strong cold frontal passage and in the post frontal air. These winds caused minor structural damage to a building in O'Donnell (Lynn County). A tree was blown onto a house in Plainview (Hale County) and caused minor damage to the structure's roof. A 100 foot radio communications tower was destroyed by the winds in Paducah (Cottle County) during the mid-morning hours. The tower fell onto and damaged three vehicles in a parking lot, and also downed utility lines. An estimated 250 homes and businesses lost power as a result of the damages, but no injuries were reported. In addition, the winds downed utility lines

Location	Date/Time	Deaths &	Property &	Event Type and Details
		Injuries	Crop Dmg	

at an oil well facility in western Cochran County. The downed lines sparked a wind-driven wildfire which consumed between 300 and 500 acres before it was extinguished during the afternoon hours of the 2nd. The fire remained over open country and no damages were reported.

As the upper air storm system passed over the South Plains during the pre-dawn hours of the 2nd, a band of mixed wintry precipitation developed from the extreme southwestern Texas Panhandle eastward over the northeastern South Plains. A mixture of sleet and snow resulted in a localized band of light accumulations, including a measured one inch accumulation at Floydada (Floyd County).

Total damages across the region were estimated at \$135,000.

A list of measured severe wind gusts follows: 67 mph at Plains (Yoakum County), 64 mph at Memphis (Hall County) and White River Lake (Crosby County), 63 mph at Graham (Garza County), 62 mph at Silverton (Briscoe County), 61 mph at Plainview (Hale County) and west of Sundown (Cochran County), 60 mph at Lubbock (Lubbock County), 59 mph at Dimmitt (Castro County), and 58 mph at Morton (Cochran County).

High winds downed a 100 foot radio communications tower in Paducah (Cottle County) during the morning hours of the 2nd. The tower fell onto and damaged cars in a parking lot. Photo courtesy: Randy Detwiler - Paducah Fire Department.

A potent storm system swept over the U.S. Southern Plains on the 4th and produced damaging westerly winds that contributed to blowing dust and wildfires across west Texas.

While the most significant public impacts occurred over the Texas Panhandle, winds sustained at speeds greater than 40 mph and gusts up to 66 mph were recorded by the Texas Tech University West Texas Mesonet and the KVII-TV Schoolnet over the extreme southwestern Panhandle and the northern South Plains. Local officials reported that these winds caused near-zero visibilities in blowing dust along U.S. Highway 60 in Parmer County, where a few minor vehicular collisions occurred. The structure of a business in downtown Friona (Parmer County) was partially unroofed by the winds, and a downed tree fell onto a car in Dimmitt (Castro County). No injuries were reported.

The strong winds downed a number of utility lines, which combined with abnormally warm temperatures and drought conditions resulted in at least three large wildfires. A 1,000 acre wildfire ignited just after 10:00 CST near Texas Highway 86 on the Castro and Swisher County Line. This fire destroyed a home, but no injuries were reported. A fire estimated to have consumed 400 acres began just east of Claytonville (Swisher County) and spread eastward over the Briscoe County line shortly after 12:30 CST. A third wildfire burned at least 300 acres and damaged oil field equipment in western Yoakum County, when winds downed power lines north of Denver City just after 16:00 CST. The fires resulted in no injuries on the South Plains, but wind and fire-related weather hazards combined to result in an estimated \$125,000 in damages.

A list of measured severe wind gusts follows: 66 mph at Lazbuddie (Parmer County), 65 mph at Dimmitt (Castro County), 65 mph at Friona (Parmer County), 63 mph at Hart (Castro County), and 61 mph at Silverton (Briscoe County).

A storm system impacted the Southern Plains on the 9th and produced widespread strong westerly winds and blowing dust over west Texas. Sustained winds up to 44 mph and gusts as high as 62 mph were recorded at a number of Texas Tech University West Texas Mesonet and Automated Surface Observing System sites across the South Plains region.

The winds severely damaged a Texas Forest Service greenhouse near Idalou (Lubbock County) and destroyed a bank awning in Wolfforth (Lubbock County). A number of homes reportly sustained minor roof damage in the Lubbock vicinity. Property damages were estimated near \$250,000.

The winds additionally combined with the ongoing drought to result in several fire starts across the South Plains, but none of the fire starts evolved into significant wildfires. A devastating wildfire outbreak, however, impacted areas east of the South Plains region.

A list of severe wind gusts measured by area surface observing sites follows: 62 mph at Childress (Childress County), 62 mph at Lubbock (Lubbock County), 61 mph at Turkey (Hall County), 60 mph at Anton (Hockley County), 60 mph at Aspermont (Stonewall County), 59 mph at Amherst (Lamb County), 59 mph at Floydada (Floyd County), 59 mph at O'Donnell (Lynn County), 59 mph at Paducah (Cottle County), 59 mph at Plainview (Hale County), 59 mph at Roaring Springs (Motley County), 58 mph at Hart (Lamb County), and 58 mph at Plains (Yoakum County).

A linear multicell thunderstorm complex impacted Yoakum County in the wake of an earlier supercell storm. This second round of thunderstorms produced a severe wind gust of 60 mph that was recorded by the Texas Tech University West Texas Mesonet west-northwest of Denver City. No damage was reported.

#### A significant severe weather episode impacted portions of southeastern New Mexico and the west Texas Permian Basin during the late

afternoon and evening hours of the 11th. The sto	rms developed east of a dryli	ne and south of a	a warm front which	advanced northward

over the South Plains region. Thus cool stable air north of the frontal boundary precluded widespread severe weather over much of the South Plains, but a few thunderstorms, including a supercell storm, impacted the far southwestern portions of the South Plains region. While Doppler radar indicated the potential for a tornado with this storm over southern Yoakum County, no tornado was confirmed. Large hail and damaging thunderstorm winds, however, were observed.

CHILDRESS COUNTY 4.0 NW CHILDRESS [34.46, -100.25]						
04/12/09 14:54 CST	0	Hail (0.88 in)				
04/12/09 14:54 CST	0	Source: Law Enforcement				

Local law enforcement officials reported nickel size hail along U.S. Highway 287 just northwest of Childress.

Scattered thunderstorms developed over the extreme southeastern Texas Panhandle and the northern South Plains during the afternoon hours of the 12th as a middle atmospheric storm system moved over the area. At least one thunderstorm became severe and produced hail up to the size of nickels northwest of Childress.

SWISHER COUNTY KRESS [34.37, -101.75], TULIA [34.53, -101.77], 2.8 WSW TULIA ARP	T [34.54, -101.83], 3.0	) W KRESS [34.38, -101.80]
04/16/09 12:50 CST	0.50M	Flood (due to Heavy Rain)
04/16/09 23:20 CST	0	Source: Newspaper

Thunderstorms began to impact portions of Swisher County just before 13:00 CST on the 16th. These storms quickly became severe and displayed occasional supercellular characteristics as they effectively trained over the Interstate 27 corridor.

A combination of heavy rainfall and accumulating hail resulted in a prolonged closure of Interstate 27 during the afternoon and overnight hours of the 16th and into the morning of the 17th. The most significant impacts occurred between Kress and Tulia. Up to 50 vehicles became stranded on the interstate as high water and hail covered the driving surface. Some motorists were rescued from their stalled automobiles with the use of boats and fire engines. Up to 5.27 inches of rainfall was measured by the Texas Tech University West Texas Mesonet site near Tulia, and 5.90 inches was measured by the Tulia National Weather Service cooperative observer. Ponded water receded sufficiently from the highway by 07:00 CST on the 17th, and the interstate was re-opened. No serious injuries were reported, but combined damages from hail and floods were estimated near \$1 million.

SWISHER COUNTY 1.0 SW KRESS [34.36, -101.76], 5.0 S TULIA [34.46, -101.77]				
04/16/09 13:00 CST	0.50M	Hail (1.25 in)		
04/16/09 14:30 CST	0	Source: Trained Spotter		

A supercell thunderstorm which developed over portions of northern Hale and southern Swisher Counties evolved into a small convective complex which effectively trained over Interstate 27. As a result, vast amounts of large hail and very heavy rainfall resulted in dangerous travel conditions.

Hail up to the size of half dollars accumulated to depths greater than half a foot in places along Interstate 27 between Kress and Tulia. The hail combined with nearly six inches of rainfall produced significant flooding. A local law enforcement official was quoted as saying that "it was just like an ice jam...it looked like North Dakota", referring to recent national headlines concerning historic ice jam flooding in that state. Newspaper reports indicate that more than 50 vehicles were stranded by hail and high water. Several motorists were rescued from stalled vehicles by boat and fire engines. As a result, local officials were forced to close portions of Interstate 27 until hail and flood waters receded sufficiently around 07:00 CST on the 17th. Combined damages from hail and flood were estimated near \$1 million.

		Injuries	Crop Dmg	

A relatively long-lived, but weak (EF-1), tornado developed rapidly within a convective complex over northwestern Lubbock County shortly before 20:00 CST and tracked north-northeastward into southwestern Hale County.

The tornadic circulation was initially embedded within heavy rain, but was well sampled at close range by the Lubbock, Texas (KLBB) WSR-88D radar. The tornado developed just south of U.S. Highway 84 at 19:56 CST. The tornado quickly crossed U.S. Highway 84 five miles northwest of Shallowater, where a National Weather Service damage survey team found tumble weeds suspended within utility wires. The tornado then tracked north-northeastward to the west of Farm to Market Road 179. The tornado downed utility poles, damaged four structures, a livestock trailer, and additionally uprooted a large tree before crossing the Lubbock and Hale County line one mile west of the County Line community.

Two mobile homes sustained minor damage from the tornado. Skirting was removed from one home, and mud splatters were evident on the structure. A large roof panel was additionally removed from a second mobile home along county roads west of Farm to Market 179. A well-built permanent house sustained minor damage immediately southwest of County Line, near the Lubbock and Hale County line. A carport and outbuilding were destroyed at the residence and minor roof damage occurred from debris loaded wind. In addition, a large metal garage structure on the property was partially collapsed when tornadic winds caused the door to fail. A large boat stored within the structure was subsequently damaged when it was pushed by wind-loaded debris through a portion of the structure's back wall.

By 20:15 CST drier air began to occlude the tornadic circulation. This allowed visibility around the tornado to improve and a National Weather Service employee began witnessing and photographing the tornado and associated utility power flashes as it approached the Lubbock and Hale County line. The tornado blew down approximately a dozen wooden utility poles along its path as it crossed into Hale County one mile west of the County Line community at 20:16 CST.

The tornado continued until 20:20 CST in southwestern Hale County, where it resulted in additional damages to farm implements, utility poles, and an oil field shed. Damages to the two mobile homes, a single family residence and metal garage, trees, and to wooden utility poles support an EF-1 rating with estimated wind speeds between 85 and 95 mph. The tornado traveled nearly eight miles between 19:56 CST and 20:20 CST and accounted for \$130,000 in damages along its path in Lubbock and Hale Counties. No injuries were reported.

A relatively long-lived, but weak (EF-1), tornado developed rapidly within a convective complex over northwestern Lubbock County shortly before 20:00 CST and tracked north-northeastward into southwestern Hale County.

The tornado crossed the Lubbock and Hale County line at 20:16 CST one mile west of County Line, where a number of wooden utility poles were downed. The tornado then tracked northward for more than a mile and resulted in damage at a farmstead where a cotton stripper basket was blown 250 yards and destroyed. The tornado additionally destroyed a small outbuilding near an oil field northwest of County Line.

The tornado then dissipated as observed by close-range radar sampling and visually by a National Weather Service employee at 20:20 CST about a mile and a half northwest of County Line.

Damages to utility poles and the outbuilding, as well as damages to four structures and a large tree in northwestern Lubbock County support an EF-1 rating with wind speeds between 85 and 95 mph. The tornado traveled nearly eight miles between 19:56 CST and 20:20 CST, and accounted for a total of \$130,000 in damages along its path in Lubbock and Hale Counties. No injuries were reported.

04/16/09 20:26 CST	75K	Tornado (EF1, L: 2.00 mi , W: 75 yd)
04/16/09 20:30 CST	0	Source: Law Enforcement

A tornadic circulation reformed within the Lubbock and Hale County convective complex, east of the dissipated "County Line" tornado's track. Although the tornado was never witnessed by spotters or local officials, the tornado vortex was well sampled at close range by the Lubbock, Texas (KLBB) WSR-88D radar, and damage subsequently confirmed that a tornado indeed occurred.

This tornado developed very near Farm to Market Road 54 at 20:26 CST, about five and a half miles west-northwest of Abernathy, and moved northward along a two mile long track. The weak tornado broke a number of tree limbs within a shelter belt at a homestead along Farm to Market Road 54, then collapsed a small privately-owned two-way radio tower northeast of the intersection of Farm to Market Roads 54 and 2528. Damage to the radio tower was determined to support an EF-1 rating with wind speeds estimated between 90 and 100 mph. The tornado then dissipated at 20:30 CST approximately eight miles northwest of Abernathy.

A storm chaser observed a brief tornado, seen within lightning flashes and associated with utility power flashes, over rural portions of southwestern King County shortly before 22:00 CST. The tornado remained over open range land south of U.S. Highway 82 southwest of Guthrie, and was associated with the same small-scale supercell storm which previously produced a tornado over southeastern Dickens County. No damage was reported.

A severe weather outbreak occurred over west Texas during the afternoon and evening hours of the 16th and resulted in significant public impacts. Despite the occurrence of thirteen tornadoes across the South Plains region, most of the damage resulted from destructive hail and heavy rainfall.

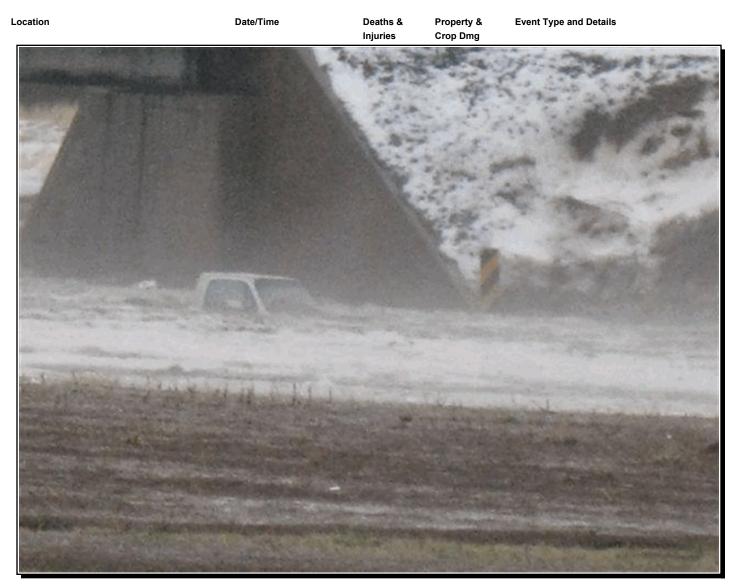

Thunderstorms first developed over the northern South Plains around 13:00 CST. These early afternoon storms initiated as supercells, but transitioned into a small-scale convective complex that produced extensive amounts of large hail and heavy rainfall. As the storms trained over the Interstate 27 corridor in Swisher County, a significant hail accumulation and flood event resulted in some 50 vehicles becoming stalled and a prolonged closure of the highway through the overnight hours.

Additional storms developed during the mid to late afternoon hours over the central South Plains. Two supercell thunderstorms impacted Lubbock County. One of these storms produced a destructive hail swath through the city of Lubbock damaging some 3,000 homes and more than 1,100 vehicles totaling an estimated \$40 million in damages. Meanwhile a second supercell storm over eastern Lubbock County produced a family of weak tornadoes along U.S. Highway 82 east of Idalou.

Other supercell storms impacted portions of Garza and Kent Counties during the late afternoon and early evening hours. These storms additionally produced damaging hail and brief tornadoes.

By late evening, storm modes transitioned toward broken convective complexes and multicell structures. An unstable low-level environment, however, continued to be characterized by an increasingly enhanced veering of the wind fields. Thus, despite a transition toward less discrete storm cells, the threat for tornadoes remained. Multiple small scale low-level circulations developed within the evolving convective complexes, and these circulations proved to be tornadic. An EF-1 tornado damaged five structures and downed power poles as it tracked nearly eight miles across northwestern Lubbock County and southwestern Hale County around 20:00 CST. Two additional EF-1 tornadoes impacted the Abernathy (Hale County) and Roosevelt (Lubbock County) areas through the 21:00 CST hour. Meanwhile, similar tornadic circulations developed within other storm complexes over portions of Dickens, Kent, and King Counties. Multiple reports of tornadoes were received from rural areas around the Spur, Girard, and Guthrie vicinities but no damages resulted.

In all, an estimated \$41.3 million in damages and three injuries resulted from severe weather across the South Plains region of west Texas on the 16th.

A combination of accumulating hail and heavy rainfall resulted in "ice jam-like" flooding along Interstate 27 between Kress and Tulia in Swisher County during the afternoon and evening of the 16th. Photo courtesy: Julie White - via KCBD-TV - Lubbock, Texas.

KING COUNTY 12.0 ESE GUTHRIE [33.55, -100.14], 15.0 ESE GUTHRIE [33.54, -100.09]					
04/26/09 13:28 CST	0	Hail (1.25 in)

An isolated supercell thunderstorm developed near a dryline over the eastern Rolling Plains of west Texas during the mid afternoon hours of the 26th. This storm produced a swath of large hail up to the size of half dollars along U.S. Highway 82, roughly between that highway's intersections with Texas Highway's 365 and 114. No damage was reported.

KING COUNTY 2.0 W GUTHRIE [33.62, -100.36], 2.0 N GUTHRIE [33.65, -100.33]					
04/26/09 16:13 CST	0	Hail (1.75 in)			
04/26/09 16:17 CST	0	Source: Law Enforcement			

Another round of more scattered thunderstorms developed along and east of the dryline by the late afternoon hours of the 26th. An isolated storm became severe in King County, and produced a swath of large hail up to the size of golfballs from just west of Guthrie to just north of that town. No damage was reported.

A dryline served as a focus for thunderstorm development during the afternoon hours of the 26th over the Rolling Plains of west Texas. An isolated storm initially developed during the mid afternoon hours, and produced a swath of large hail in eastern King County. More scattered thunderstorm activity re-initiated during the late afternoon. Again, a severe storm embedded within this activity, produced up to golfball size hail in King County near Guthrie. No damage was reported.

Multiple public and law enforcement reports of large hail that ranged in size from nickels to golfballs were received in the Guthrie vicinity.

An active severe weather event evolved over the west Texas South Plains region during the afternoon and evening hours of the 29th. Overnight convection over the Southern Plains resulted in a complex surface weather pattern through the day on the 29th. Thunderstorms initiated shortly after midday along an outflow boundary over the northern Permian Basin and southern South Plains. One of these storms produced large hail in Stonewall County during the early afternoon.

More significant severe storms developed during the late afternoon hours, as convection initiated along another pre-existing outflow boundary and its intersecting triple point with a dryline. These storms developed in a very unstable airmass, and low-level wind shear along and north of the outflow boundary was sufficient to promote tornado development. Supercell thunderstorms that developed near this boundary began to produce tornadoes and very large hail over the northeastern South Plains and the extreme southeastern Panhandle shortly after 15:00 CST. While several of the tornadoes were relatively long-lived and appeared to be capable of significant damage, they remained over open range land. Only a single instance of tornado damage occurred, when an EF-1 tornado downed wooden utility poles along Farm to Market Road 97 near Cedar Hill in northeastern Floyd County.

The most significant public impacts from these storms occurred in Paducah (Cottle County), where a massive high-precipitation supercell produced very strong winds and wind-driven hail that damaged vehicles, light structures, trees, and utilities. No injuries were reported.

A brief tornado developed east of South Plains in extreme northeastern Floyd County just before 16:15 CST on the 29th. Photo courtesy: Matt Ziebell - National Weather Service - Lubbock, Texas.

Despite a wet summer and early fall of 2008, precipitation was scarce over the west Texas South Plains region, especially over the southern Rolling Plains from late October 2008 through May 2009. Severe (D2) drought initially developed over the Rolling Plains during late January 2009. By mid April 2009, several widespread rain events had helped to provide a temporary reprieve of drought conditions over most of the area. The area impacted by Severe (2) drought had lessened over the southern Rolling Plains. However, May 2009 saw a low coverage and intensity of convective rainfalls as compared to climatology. Thus, with long-term rainfall deficits on the increase, drought conditions intensified to Extreme (D3) drought over the southern Rolling Plains of West Texas by the end of May.

Severe (D2) drought was ongoing over Kent, King, and Stonewall Counties at the beginning of May. Rainfall deficits for the previous six month period increased to between four and six inches over the southern Rolling Plains by the end of the month. These deficits represented 40% to 50% of climatological averages.

Following the failure of winter wheat crops in previous months, agricultural impacts in May began to include delays in cotton planting--the area's primary industry. Local cotton experts reported that the lack of wetting rainfall events in May made it difficult for farmers to plant. However, the lack of rainfall would not become critical until early June, when crop insurance deadlines required cotton crops to be in the fields.

State agricultural officials estimate that cattle losses related to the drought will exceed \$1 billion. Only a fraction of those losses occurred in the South Plains region with most of the land usage locally being for cotton production.

The total economic impact across the South Plains region in May was estimated at \$6 million with approximately \$24 million dollars of economic loss occurring locally since the onset of severe (D2) drought conditions in January 2009.
