A county official measured quarter size hail three r	niles south of Estelline.			

Severe thunderstorms erupted for a second straight day across the South Plains. A large upper level low over the western United States allowed for low level moisture to remain in the region under low level southeasterly flow. A weak short wave moved out of central New Mexico into West Texas during the afternoon hours which aided in convective development along a dryline. Two general areas of convection matured into severe thunderstorms: one in the southwestern Texas Panhandle and another in the southern South Plains into the Permian Basin. Although there was no initial development in the central South Plains, this area saw the largest hail of the afternoon. Storms across the extreme southwestern Texas Panhandle generally produced hail up to ping pong ball size. At the same time, a severe thunderstorm near Post (Garza County) produced hail up to tennis ball size. The initial thunderstorms in the southern South Plains generated an outflow boundary that surged northward lifting very unstable air. Multi cellular thunderstorms developed along this outflow boundary in Lynn County but quickly moved northward into Lubbock County. One of these storms took on a anticyclonic circulation as it moved into southern Lubbock County. This storm would go on to produce a widespread swath of hail with sizes generally between hen eggs and tennis balls. The largest hailstone observed was three inches in diameter around the intersection of Quaker Ave. and 114th Street. The swath of giant hail began on the south side of the city of Lubbock (Lubbock County) and ended around Lubbock Preston Smith International Airport (Lubbock County). One of the other thunderstorms that developed on the outflow boundary also produced severe hail at the same time over the western portion of Lubbock County. This swath of hail was observed from just east of Wolfforth (Lubbock County) to Texas Tech University (Lubbock County) and consisted of hail mostly around golf ball size. Total damages in Lubbock County were estimated at \$100 million due to substantial and widespread roof and vehicle damage.

STONEWALL COUNTY ASPERMONT [33.15, -100.23]			
05/21/20 17:43 CST	0	Hail (1.75 in)	
05/21/20 18:00 CST	0	Source: Law Enforcement	

Reports were received from both law enforcement and a storm chaser in Stonewall County of hail ranging from half dollar to golf ball size.

On the afternoon of the 22nd, thunderstorms developed across the Big Country of Texas into the southern Rolling Plains in the vicinity of an intersection of a dryline and a remnant outflow boundary. Ample instability allowed thunderstorms to quickly become severe producing hail up to golf ball size in Aspermont (Stonewall County).

A Texas Tech University West Texas mesonet site near Jayton measured a wind gust to 64 mph.

Widespread supercell thunderstorms developed across the South Plains on the afternoon and evening of the 23rd producing very large hail, a tornado, and flash flooding.

From the night of the 22nd through the morning of the 23rd, a dryline surged westward allowing abundant low level moisture to return to the region. This dryline mixed to the east during the afternoon stalling around US Highway 385. A capping inversion initially kept convective initiation from occurring until late in the afternoon under a very unstable atmosphere with CAPE values in excess of 4000 J/kg. Initially, the most intense thunderstorm developed and became anchored over southwestern Garza County. This supercell exhibited strong rotation at low and mid levels of the storm. Several storm chasers observed a tornado over open land that lasted for about 11 minutes. Because of the very slow storm motion of this thunderstorm, the tornado was nearly stationary for its entire lifetime. A lack of roads in the path of the tornado prevented a storm survey from being completed, thus this tornado could not be rated. Heavy rain fell over an extended period of time in Garza County due to the storm's nearly stationary movement. As a result, a portion of Farm to Market road 669 south of Post was washed out.

The thunderstorms that developed in the southeastern South Plains generated a strong outflow boundary which then moved through the central South Plains. This outflow boundary caused scattered thunderstorms to grow over Lubbock County in which many of these became severe over multiple parts of the city of Lubbock. Hail up to two inches was reported in the city of Lubbock along with wind gusts up to 62 mph. This outflow boundary continued to move northward creating additional severe thunderstorms over the extreme south-central Texas Panhandle. One of these storms produced hail up to three inches in diameter in the city of Silverton (Briscoe County) leading to widespread damage to vehicles.

Trailing stratiform precipitation from decaying thunderstorms generated a couple of non-thunderstorm severe wind gusts. One of these occurred at Caprock Canyons State Park where a Texas Tech University West Texas mesonet site measured a wind gust to 58 mph. The other was at the Automated Surface Observing System at Childress Municipal Airport measuring a gust to 58 mph.

Severe thunderstorms erupted for a second straight day across the South Plains. A weak short wave moved out of central New Mexico into West Texas during the afternoon hours which aided in convective development along a dryline. Two general areas of convection matured into severe thunderstorms: one in the south central South Plains and another across the southeastern Texas Panhandle. Multi-cellular thunderstorms developed in Hockley County but quickly moved eastward into Lubbock and Lynn Counties. These storms produced mostly one inch sized hail, but hail as big as an inch and a half was reported by a weather spotter in the southern part of the city of Lubbock (Lubbock County). As the storms matured they began to form a line and produced more inch size hail in the central Rolling Plains as well as severe wind gusts near Guthrie (King County). A few reports of damage were reported including downed power poles in Briscoe County and a demolished office trailer in Hockley County. No injuries were reported.

Late that same day after storms has moved through the Southern Texas Panhandle, severe non-thunderstorm winds were recorded near the city of Lesley (Hall County). Severe non-thunderstorm severe wind gusts are listed below from the Texas Tech University West Texas mesonet:

65 mph at Lesley (Hall County) and 64 mph at Turkey (Hall County).
