Weather Summary

Rapid snow melt and heavy rain event, gusty winds, high dew points, ice breakup and backwater. The Winter Flood of 1996 began January 18 and 19 ahead of a strong cold front. In the day leading up to the floods, strong southerly winds and dew points reaching in to 50's created ideal conditions to melt the snowpack that was covering the entire Mid-Atlantic region. As the cold front moved through the area on January 19 and 20, intense rainfall accelerated the snowmelt even further, causing massive amounts of runoff to enter the rivers and streams. The flooding was the worst to hit the entire MARFC area in over 20 years. Some smaller streams broke their all-time flood records. Pennsylvania cities saw their worst flooding since Hurricane Agnes in 1972.
