From Michelle Mainelli
 Acting Director, NWS Office of Observations

Subject: Satellite Broadcast Network to Broadcast GOES-18 Imagery Aug 1 -
 Sep 6, 2022 and Oct 15 - Nov 11, 2022

GOES-18 (previously known as GOES-T), the newest satellite in the Geostationary Operational Environmental Satellite (GOES) series, launched into orbit on March 1, 2022 and is currently undergoing post-launch testing. In early CY2023, GOES-18 is expected to become the operational GOES-West satellite, replacing the GOES-17 satellite.

Between August 1 and September 6, 2022 (36 days), and again between October 15 and November 11, 2022 (27 days), the NWS Satellite Broadcast Network (SBN) will transmit Sectorized Cloud and Moisture Imagery (SCMI) from the GOES-18 Advanced Baseline Imager (ABI), but not from the GOES-17 (GOES-West) ABI. The above dates are approximate.

Those two time periods correspond to the periods of greatest degradation of the GOES-17 ABI imagery due to its Loop Heat Pipe anomaly.

During those time periods, GOES-18 ABI data obtained through the SBN should be treated as nominal GOES-West operational data.

For testing purposes, the SBN will also transmit GOES-18 ABI imagery in lieu of GOES-17 ABI imagery for up to 4 hours on June 30, 2022.

Outside of those time periods, until early CY2023, the SBN will receive and broadcast ABI imagery from GOES-17 (as it does today), and not from GOES-18.

Until further notice, none of the above will affect GOES-West ABI Level-2 (L2) Derived Products on SBN: they will continue to be from GOES-17 (even when its ABI performance is degraded due to the Loop Heat Pipe anomaly). Selected GOES-18 L2 products may be activated on SBN once they have reached maturity levels suitable for operations. If so, these would be the subject of later Service Change Notice(s).

In early CY2023, when GOES-18 assumes the operational GOES-West role, its data products will permanently replace those from GOES-17 on SBN. This transition will be the subject of a later Service Change Notice.

GOES-18 ABI imagery will use the "GRW" channel of SBN (Port 1209, PID 107, the same channel used for GOES-17 (West) ABI imagery) and the same WMO headers assigned to GOES-17 (West) imagery:

TIR[AHTW]{01..16} KNES or
TIU[A-Z]{01..16} KNES

as detailed in Service Change Notice [SCN18-106](#).

Although the same WMO headers will be used for GOES-17 and GOES-18 ABI imagery, users can still determine the satellite source via the spacecraft ID within the metadata of all products.

Details on the GOES-18 Post-Launch Testing and Transition to Operations are available from the GOES-R Program at <https://www.goes-r.gov/users/transitionToOperations18.html>.

Scientific details on these data products are available from the GOES-R Program at <https://www.goes-r.gov/resources/docs.html>.

Critical weather or other factors may delay these changes on the SBN.
