Subject: Corrected: Removal of the Experimental Aviation Summer Weather Dashboard: Effective October 30, 2014

Corrected to mention need for more developmental work and to delete link.

NWS will eliminate the Experimental Aviation Summer Weather Dashboard (AWSD) on October 30, 2014. The Experimental AWSD depicts the potential of convective weather impact to the Core 30 (minus Honolulu) airports. The AWSD, updated four times per day, shows the potential impact to each airspace through a matrix of color-coded boxes that depict nominal (green), slight (yellow), moderate (orange), and high (red) likelihood of occurrence out through a Day 2 forecast. The probabilistic information is calculated using the Short-Range Ensemble Forecast (SREF) numerical weather prediction system.

The ASWD was developed to support the Federal Aviation Administration Air Traffic Control System Command Center to coordinate long range strategic summer weather planning by providing guidance on the impact from weather at major airports.

Feedback on the experimental ASWD indicated NWS needs to complete additional developmental work to support the intended use of this decision support guidance.

For questions about this experimental forecast, please contact:
