            Other NWS Partners, Users and Employees

From:     Timothy McClung
            Science Plans Branch Chief
            Office of Science and Technology

Subject:  Amended to postpone the upgrade date to July 23, 2013
due to the delay in the transition of the NCEP
production suite to the WCOSS supercomputer

Effective on or about Tuesday, July 23, 2013, beginning with the
1200 Coordinated Universal Time (UTC) run, the National Centers
for Environmental Prediction (NCEP) will upgrade the HYSPLIT
modeling system including smoke, dust and volcanic ash.

The NOAA Air Resources Laboratory HYSPLIT subversion number 339
will be implemented as NCEP version 7.0.0 on NCEP's new Weather
and Climate Operational Supercomputing System (WCOSS), scheduled
to become the operational machine on July 23, 2013. A separate
TIN will be issued announcing the operational switch to the
Weather and Climate Operational Supercomputing System (WCOSS)
system. In the event that switch date is changed, this TIN will
be modified to reflect that change in implementation date.

Forecasts from the updated HYSPLIT model will be made available
through a parallel feed from WCOSS starting around June 19,
2013. The smoke and dust HYSPLIT GRIB products from the parallel
feed are disseminated via the NCEP website:

http://www.emc.ncep.noaa.gov/mmb/aq/hysplit/grib/

and the products will be displayed through NCEP's website:

http://www.emc.ncep.noaa.gov/mmb/aq/hysplit/web/html/#picture

Current operational HYSPLIT model will continue providing
forecasts through NCEP Central Computing System (CCS) until the
WCOSS machine goes live on July 23, 2013. At that time updated
WCOSS smoke and dust predictions will be distributed through

ftp://tgftp.nws.noaa.gov/SL.us008001/ST.opnl/DF.gr2/DC.ndgd/GT.a
The scientific enhancements include the following:

-- Improved wet removal by reducing in-cloud particle wet removal coefficient, allowing wet removal to occur only when both precipitation and clouds are defined in the same grid cell and turned off precipitation field spatial interpolation
-- Revised horizontal puff dispersion rate to be more consistent with particle dispersion
-- Set Kanthar-Clayson vertical mixing parameterization as default
-- Relaxed maximum plume rise limits
-- Modified fires pre-processor for daily emission cycling

The model has been tested with these updates for all HYSPLIT applications at NCEP. The test showed generally similar results, except for simulations of the wet deposition from the Fukushima nuclear power plant incident of 2011, in which significant improvements occurred.

There are no changes to existing products or their contents. More details about the HYSPLIT are available at:

http://www.ready.noaa.gov/HYSPLIT.php
