

A Review of Recent Observing System Experiments

Jason Sippel

NOAA AOML/HRD

Contributions from Sarah Ditchek

Intro to OSEs

With a model that performs well (e.g., HWRF), one can effectively evaluate observing-system experiments (**OSEs**)

Recent OSE Work

Example: “End-point” dropsondes added to C-130 missions in 2018

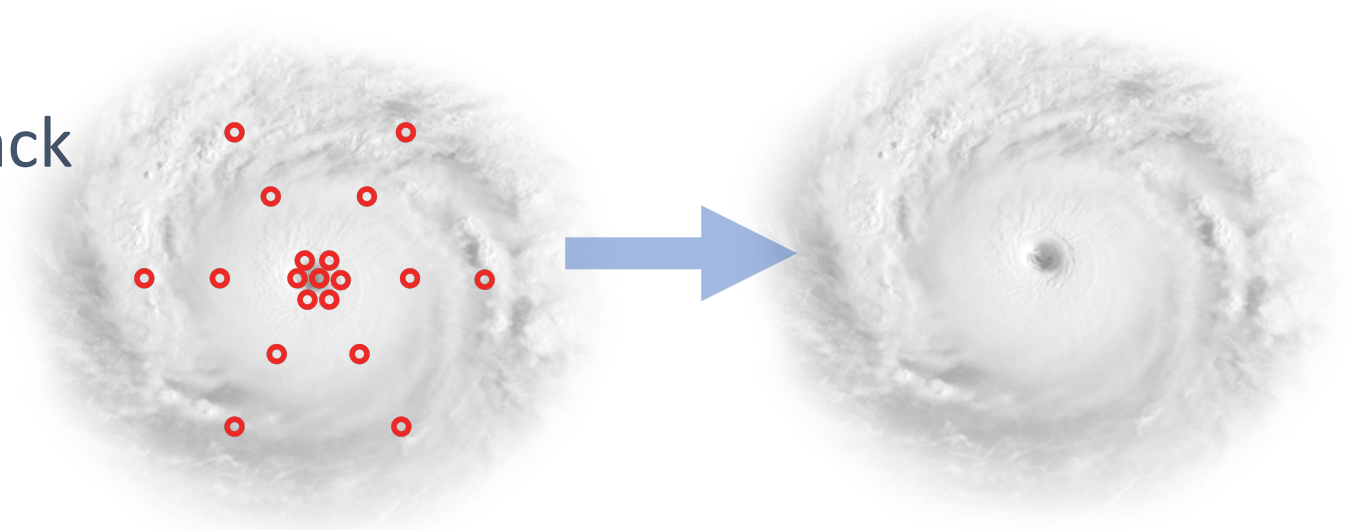

Dropsonde Impact on HWRF Intensity

Ongoing OSE Work

OK, but how do dropsondes affect the forecast... overall?

- We know they improve the track forecast
- We also know they cost \$
- A lot of unknowns

What happens in HWRF if we take away
ALL dropsondes?

Ongoing OSE Work

OVERALL IMPACT OF DROPSONDES IN HWRF

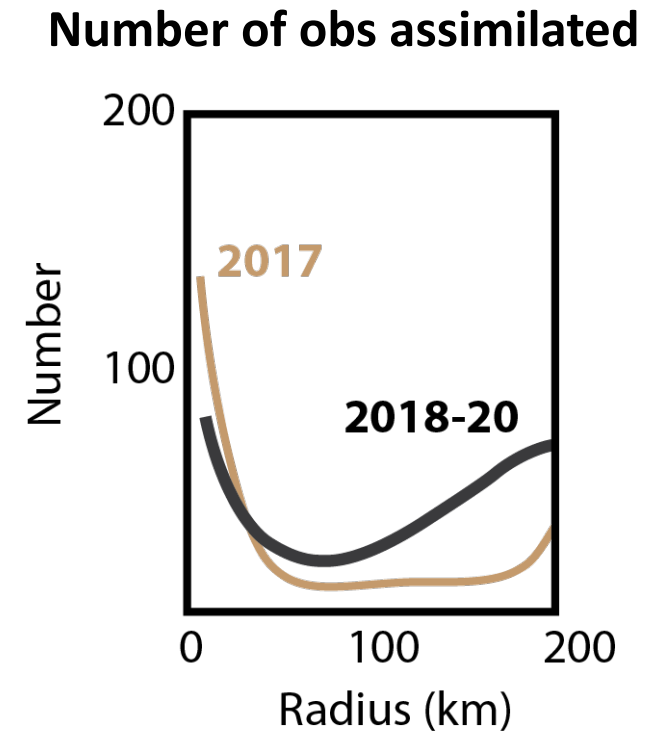

- Some benefits for track and intensity
- Big benefits for significant wind radii(!)
- What's up with R64?

Ongoing OSE Work

What's up with R64?

- R64 degraded in 2017 only (left)
- Poor near-core coverage in 2017 (right)
- Improved impacts and coverage starting in 2018

Ongoing OSE Work

*Can we say anything about how different dropsondes affect the forecast differently? **YES!***

***Example:** What are the relative impacts of environmental and over-vortex dropsondes?*

Ongoing OSE Work

Comparing environmental vs. over-vortex dropsonde impacts

Ongoing OSE Work

Comparing environmental vs. over-vortex dropsonde impacts

Ongoing OSE Work

Turning back to that USAF pattern....

TWO QUESTIONS:

1. What happens if we **ONLY HAVE** inner-core dropsondes
2. What happens if we **TAKE AWAY** inner-core dropsondes

Ongoing OSE Work

ONLY HAVE Inner-core (Major Hurr.)

REMOVE Inner-core (Major Hurr.)

1. ONLY inner-core sondes: Inner-core sondes **degrade** forecast (left)
2. Good sonde sampling: Inner-core sondes **improve** forecast (right)

Ongoing OSE Work

For optimal sampling,
we need either:

- Significantly more dropsondes; or
- Remote sensing

a) DROPSONDES ONLY

b) DROPSONDES + REMOTE SENSING

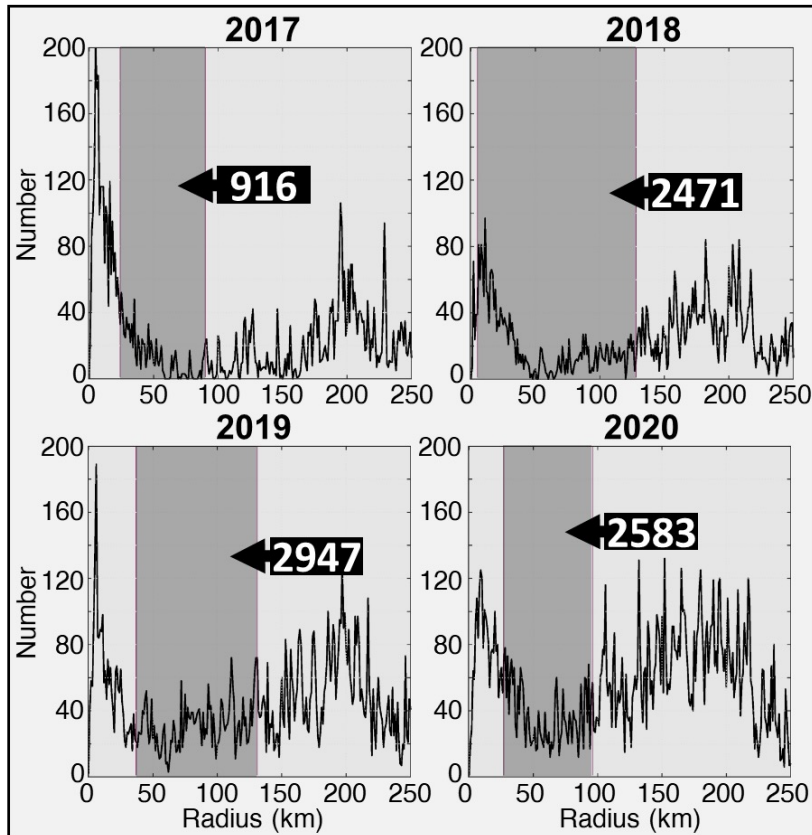

Conclusions

- Dropsondes improve most aspects of the forecast, particularly significant wind radii
- Weak storms benefit most from added dropsondes
- Gaps in coverage degrade the forecast (and can make it worse than having NO dropsondes at all)
- Optimum coverage targets all aspects of interest (e.g., significant wind radii) and argues for supplemental remote sensing observations

BONUS SLIDES

Ongoing OSE Work

Dropsondes in R64 region

Dropsonde Impact on R64

- R64 degraded in 2017 only
- Degradation corresponds with poor near-core coverage
- Improved coverage and impacts starting in 2018

Ongoing OSE Work

- R64 degraded in 2017 only
- Degradation corresponds with poor near-core coverage
- Improved coverage and impacts starting in 2018

Dropsonde Obs in R64 region

2017: 916

2018: 2471

2019: 2947

2020: 2583

Ongoing OSE Work

FOR INTENSITY (VMAX):

- Over-vortex in all storms (HUGE benefit for weak storms)
- Environment in weak storms

FOR TRACK:

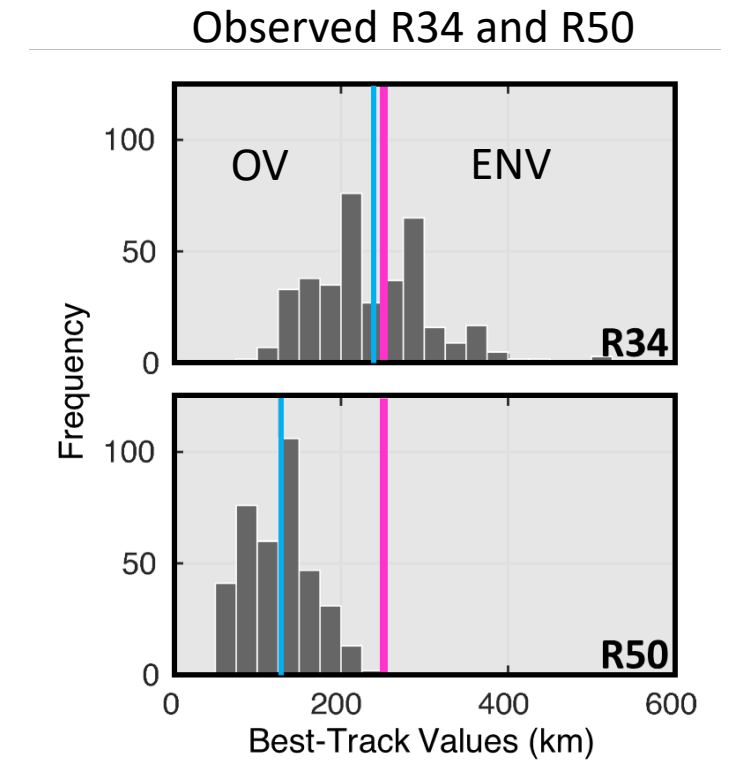

- Environment in weak storms
- Over-vortex in strong storms

Ongoing OSE Work

A closer look at strong storms:

- Observed R50 lies in the “over vortex” region
- Observed R34 near the vortex/environment border
- Sondes *either* in environment or over-vortex can improve R34, but neither region dominates

Recent OSE Work

Example 2: G-IV “Inner circumnav” added in 2018

Inner Circumnav Sondes: Impact on HWRP Track

Inner Circumnav Bonus: Additional TDR Data
