

MACHINE LEARNING AND SEVERE WEATHER FORECASTING

A look into the role of machine learning in forecasting severe weather in the extended days 4-8 at the Storm Prediction center.

DEMISTIFYING MACHINE LEARNING

WHAT KIND OF ANIMAL IS THIS?

- A. BEAR
- B. HORSE
- C. DOG
- D. CAT

**WHAT KIND OF
ANIMAL IS THIS?**

- A. BEAR
- B. HORSE
- C. DOG**
- D. CAT

HOW DID YOU ARRIVE AT YOUR ANSWER?

**WE HAVE BEEN TRAINED
THROUGH EXPERIENCE
TO KEY IN ON
FEATURES AND
PATTERNS TO HELP US
IDENTIFY ANIMALS.**

You likely considered any number of the following:

The image looked like something you had seen before.

The shape or proportions resembled a dog.

The shape had some legs, even if not the amount (or position) you might have expected...

It had a tail...maybe?

It had ears that looked like a dog's ears.

Machine Learning has more adjustable parameters compared to the sample size.

In statistical modeling, we try to keep the adjustable parameters small compared to the sample size (i.e. the number of observations).

What is the tradeoff?

Better accuracy for less interpretability.

Plainly, statistics is concerned with finding connections between variables and the significance while ML is concerned with outcomes.

**MACHINE
LEARNING VS
STATISTICAL
MODELS**

**ARTIFICIAL INTELLIGENCE REPLACES
OUR **FINITE** HUMAN PROCESSING
CAPABILITY WITH A COMPUTER'S
NEARLY INFINITE POWER AND RESOURCES.**

SIMPLIFYING COMPLEXITY: MACHINE LEARNING

Despite some complexity in the algorithms themselves, it all boils down relating inputs to outputs

Decision Trees: How does this predictor delineate days that do have a tornado and days that don't?

Neural Networks: How do these environmental parameters non-linearly relate to hail occurrence? Hail size?

VISUALIZING RANDOM FOREST

COMBINES MULTIPLE DECISION TREES,
EACH **TRAINED** ON A RANDOM
SUBSET OF THE DATA AND FEATURES,
TO MAKE PREDICTION ON OUTCOMES.

**How many severe events
have you experienced in your

Understanding Severe Thunderstorm Risk Categories

THUNDERSTORMS (no label)	1 - MARGINAL (MRGL)	2 - SLIGHT (SLGT)	3 - ENHANCED (ENH)	4 - MODERATE (MDT)	5 - HIGH (HIGH)
No severe* thunderstorms expected	Isolated severe thunderstorms possible	Scattered severe storms possible	Numerous severe storms possible	Widespread severe storms likely	Widespread severe storms expected
Lightning/flooding threats exist with <u>all</u> thunderstorms	Limited in duration and/or coverage and/or intensity	Short-lived and/or not widespread, isolated intense storms possible	More persistent and/or widespread, a few intense	Long-lived, widespread and intense	Long-lived, very widespread and particularly intense
					

* NWS defines a severe thunderstorm as measured wind gusts to at least 58 mph, and/or hail to at least one inch in diameter, and/or a tornado. All thunderstorm categories imply lightning and the potential for flooding. Categories are also tied to the probability of a severe weather event within 25 miles of your location.

CSU MACHINE LEARNING GUIDANCE

Forecasts: Issued 20250309

CSU-MLP (FV3-GEFSO) day7 severe probability forecast
issued 00 UTC Sun 09 Mar 2025 for 24 hrs ending 12 UTC Sun 16 Mar 2025

SPC day7 severe probability forecast
issued -09 UTC Sun 09 Mar 2025 for 24 hrs ending 12 UTC Sun 16 Mar 2025

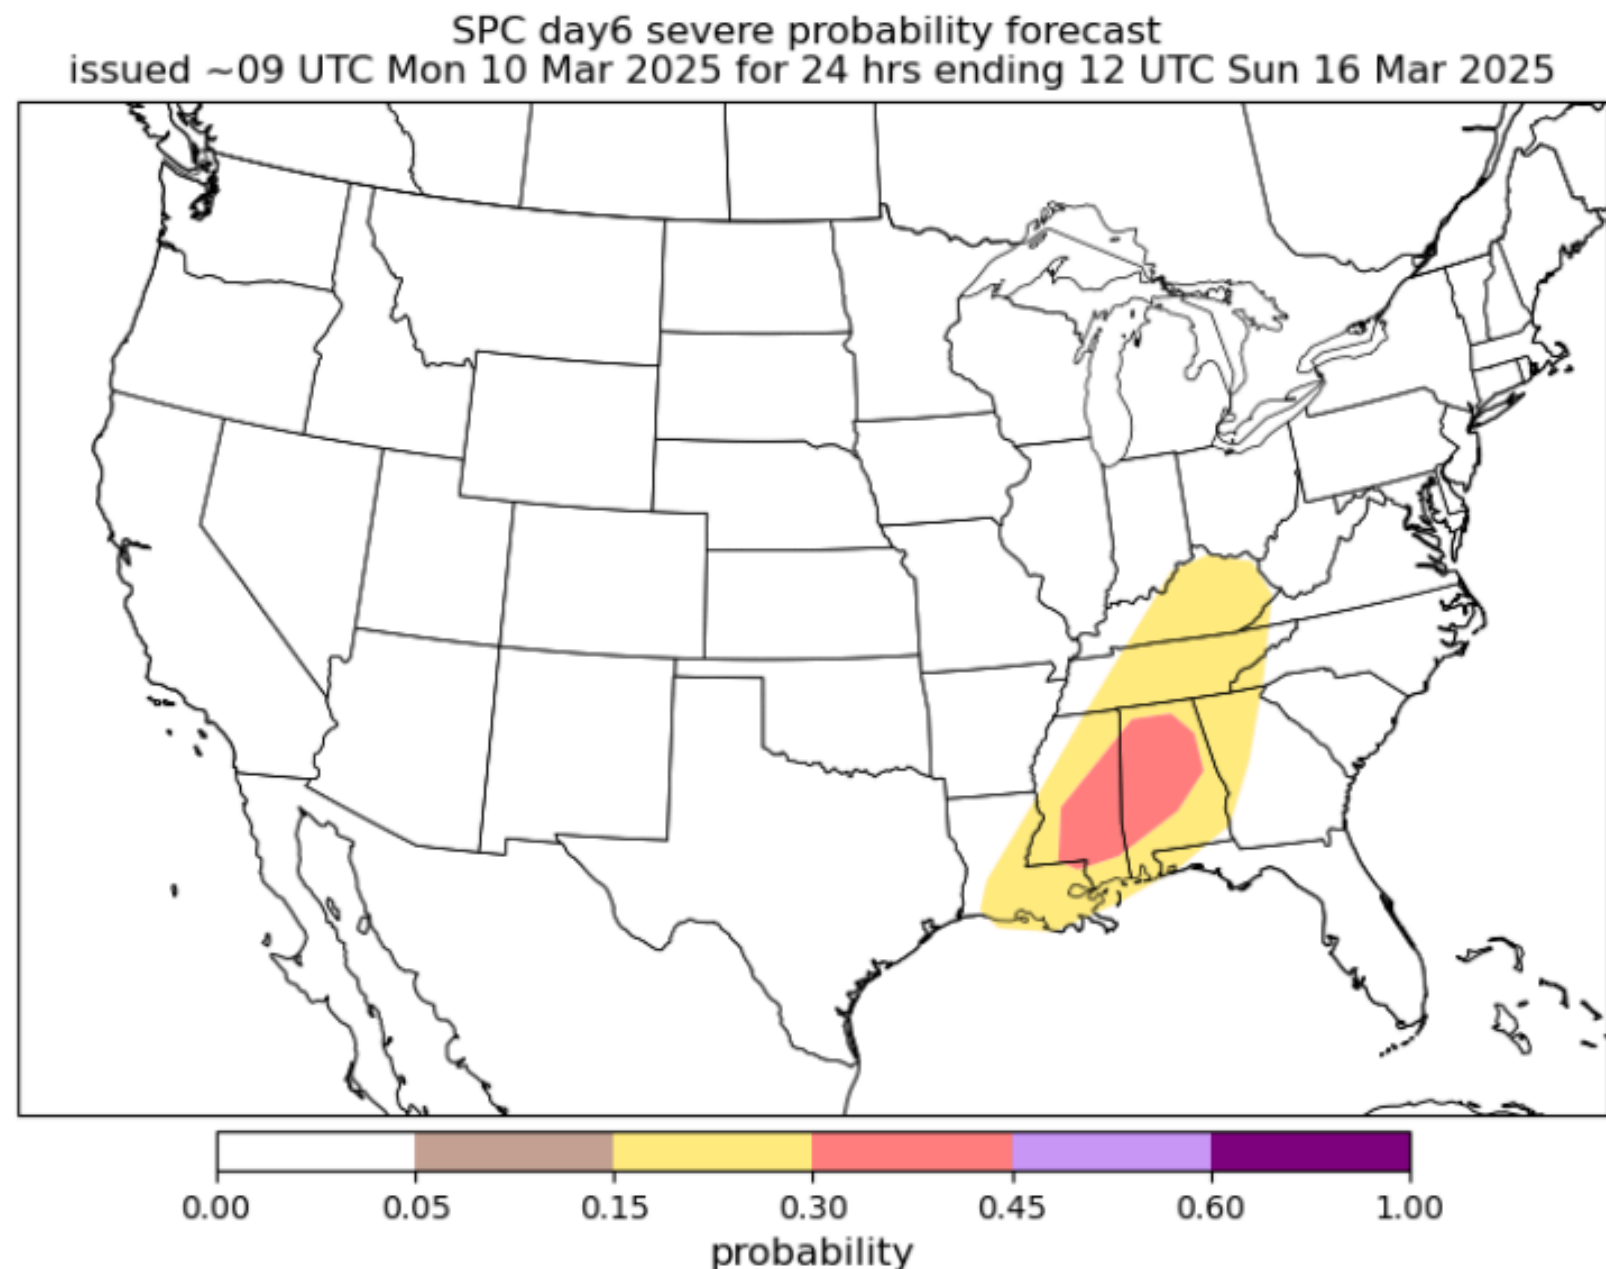

CSU MACHINE LEARNING GUIDANCE

...Day 6/Fri – Mid to Lower MS Valley vicinity...

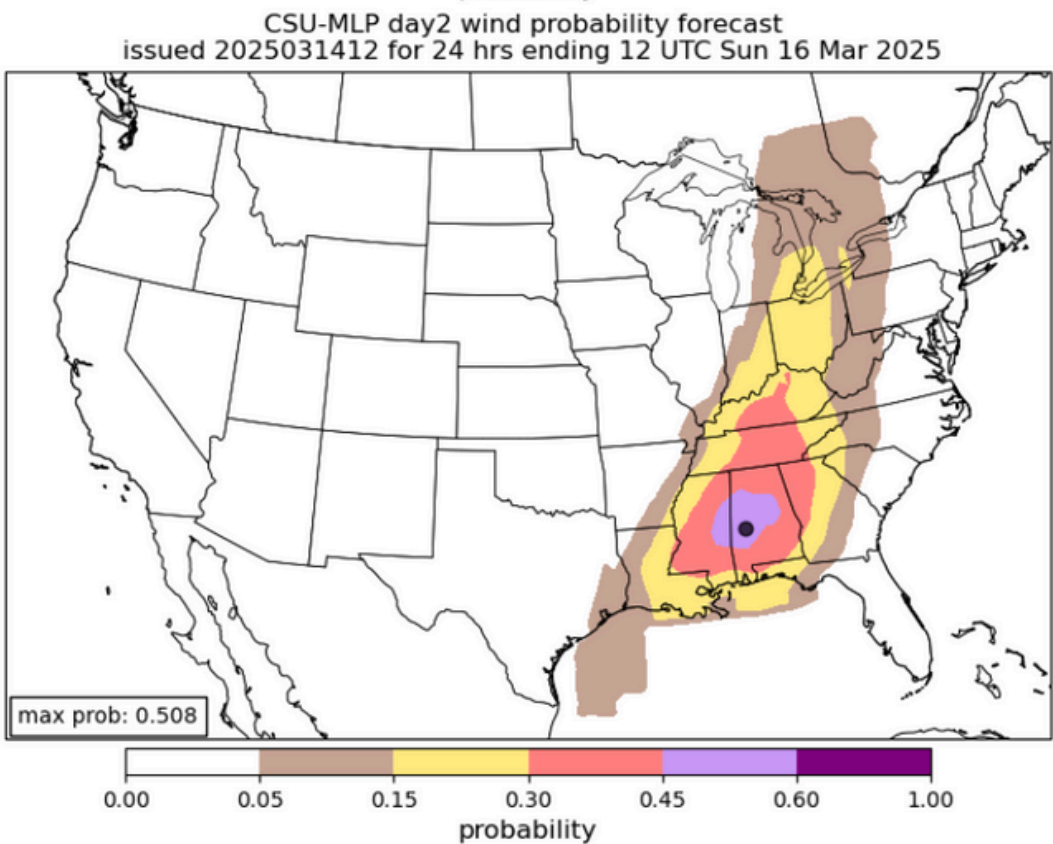

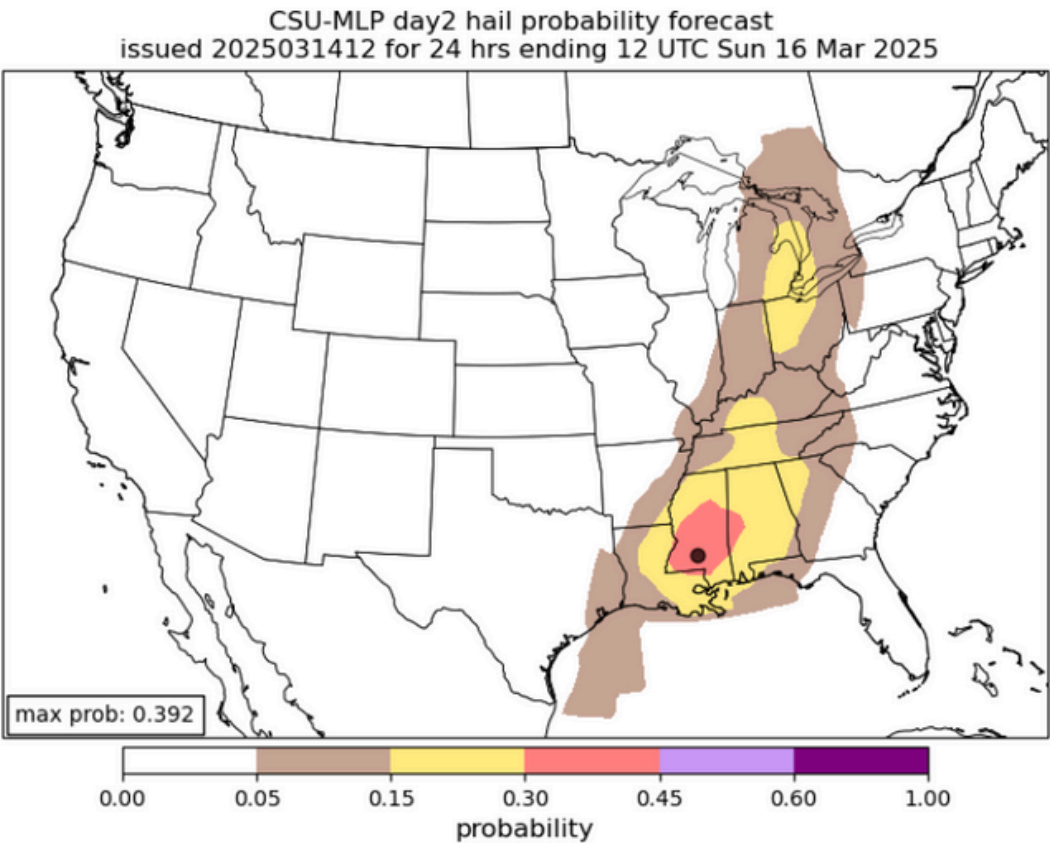

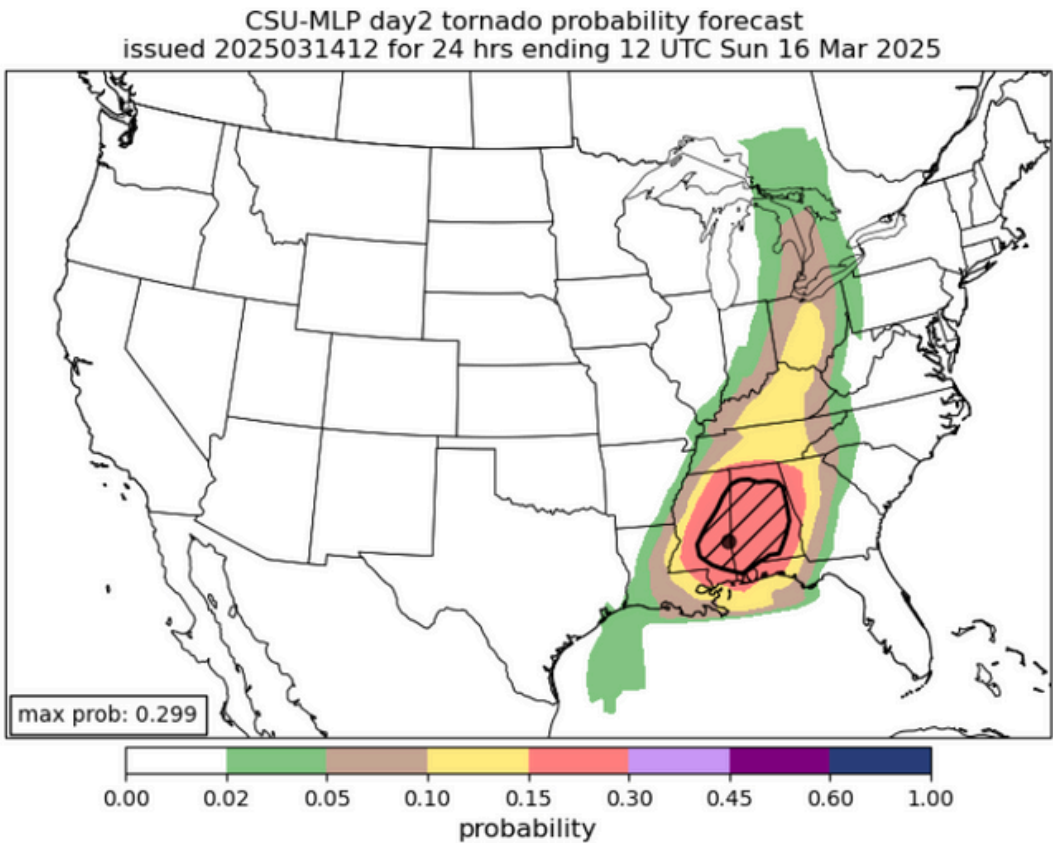

A powerful upper cyclone and attendant trough is expected to develop east across the Plains toward the MS Valley on Friday. An intense southwesterly jet (100+ kt at 500 mb) is expected to be oriented from the southern Plains to the Mid-MS Valley by Friday evening. Meanwhile, a rapidly intensifying surface cyclone will shift northeast from the central Plains to the Upper Midwest vicinity through the period. Strong southerly low-level flow ahead of this low and an attendant eastward-advancing cold front will support rapid northward transport of Gulf moisture. While details regarding quality of northward moisture transport remain, this overall pattern will be very favorable for a regional severe weather episode from late Friday afternoon into early Day 6/Sat morning.

Overall, cross-model consistency has improved compared to the past couple of days, and guidance generally appears to be converging on similar solutions. When compared with the operational ECMWF, the operational GFS remains a bit further north with the placement of the low-level and upper-level cyclones, as well as northward extent of better moisture return. However, the GEFS and EPS ensemble means are quite similar. While this indicates there is still a moderate degree of spread in the north and east extent of severe potential, the envelop is narrowing, and a broad area favorable for an all-hazards severe episode is expected on Friday/Friday night, centered on the Mid to Lower MS Valley vicinity. This trends is also aligned with SPC and NSSL experimental machine learning guidance. Given uncertainties still exist regarding timing and location of key features, as well as with northward extent of deeper moisture return, this area is likely to change/shift some over the coming days as details become better resolved (and higher probabilities will likely become necessary as well).

HISTORICAL CONTEXT

1900s

Forecasts occasionally mentioned the potential for severe weather, Weather Bureau policy continued to **prohibit use of the word "tornado" in forecasts.**

The ban on the word "tornadoes" was lifted in 1938, very few forecasts made mention of tornadoes during the 1940s.

1948-1950

Based on earlier research and on their own investigation of the conditions that produced a damaging tornado at Tinker Air Force Base in Oklahoma City on 20 March 1948 --- Air Force weather officers **E. J. Fawbush and R. C. Miller successfully predicted the occurrence of another tornado at the base five days later on 25 March.**

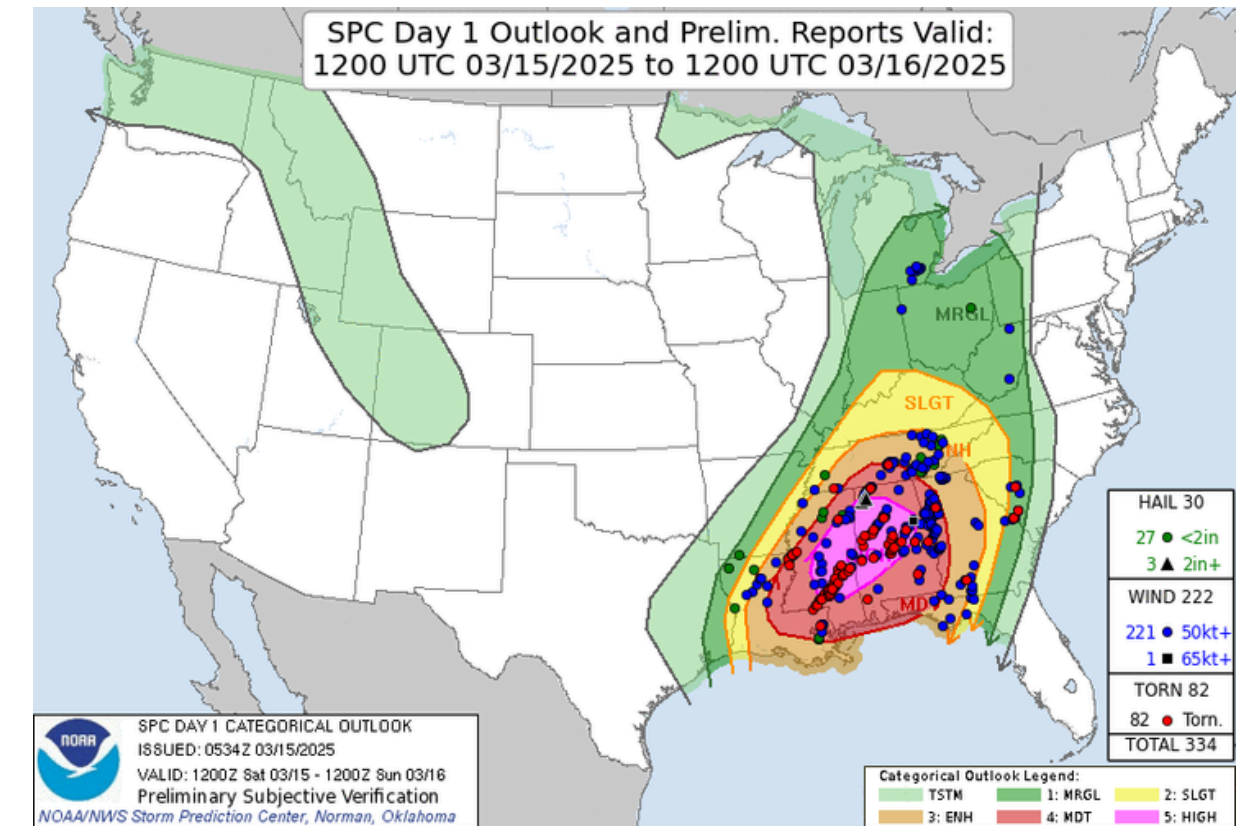

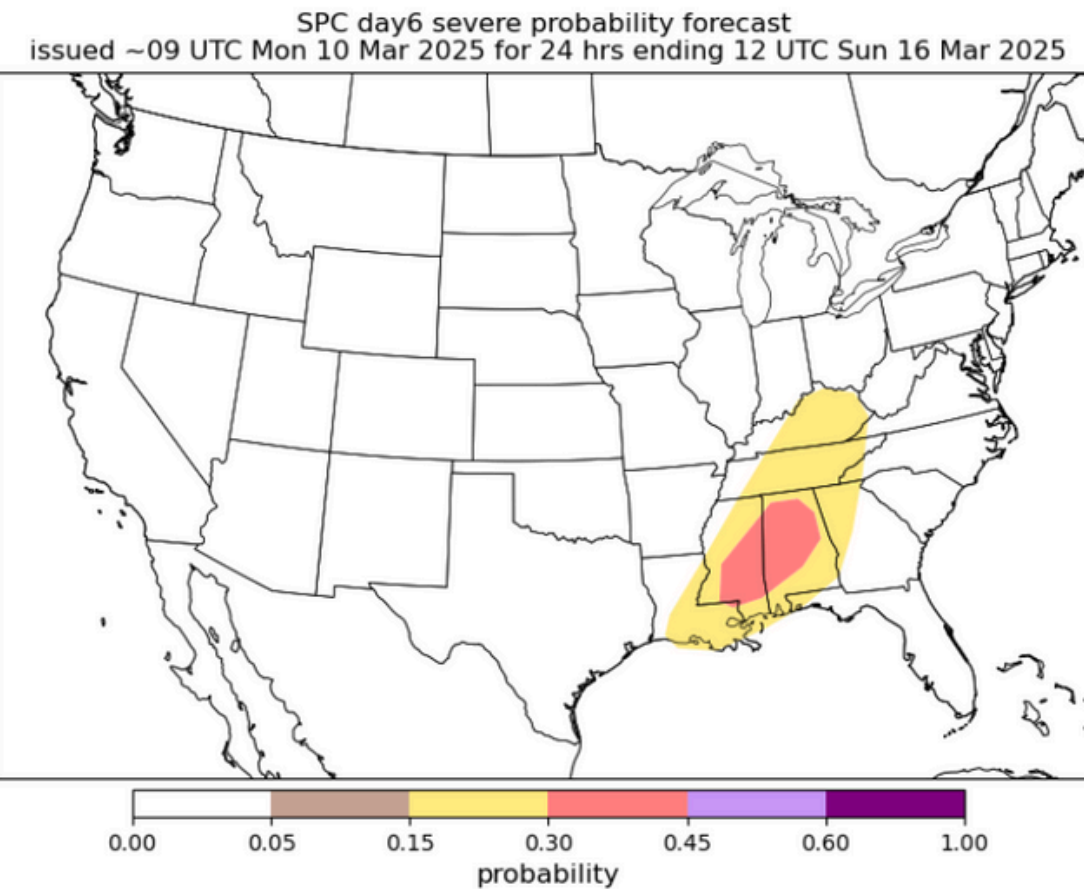

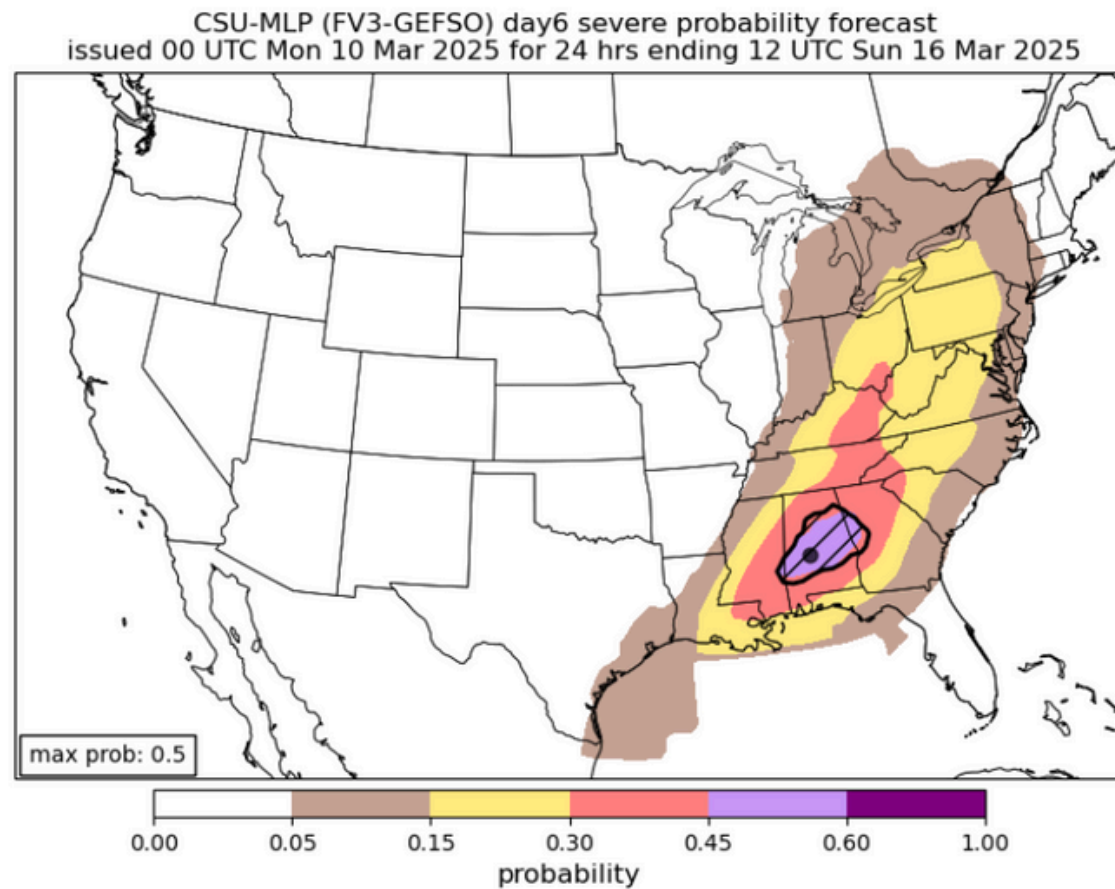

The forecast's accuracy drew considerable attention; soon the officers were responsible for Air Force tornado prediction over much of the central United States.

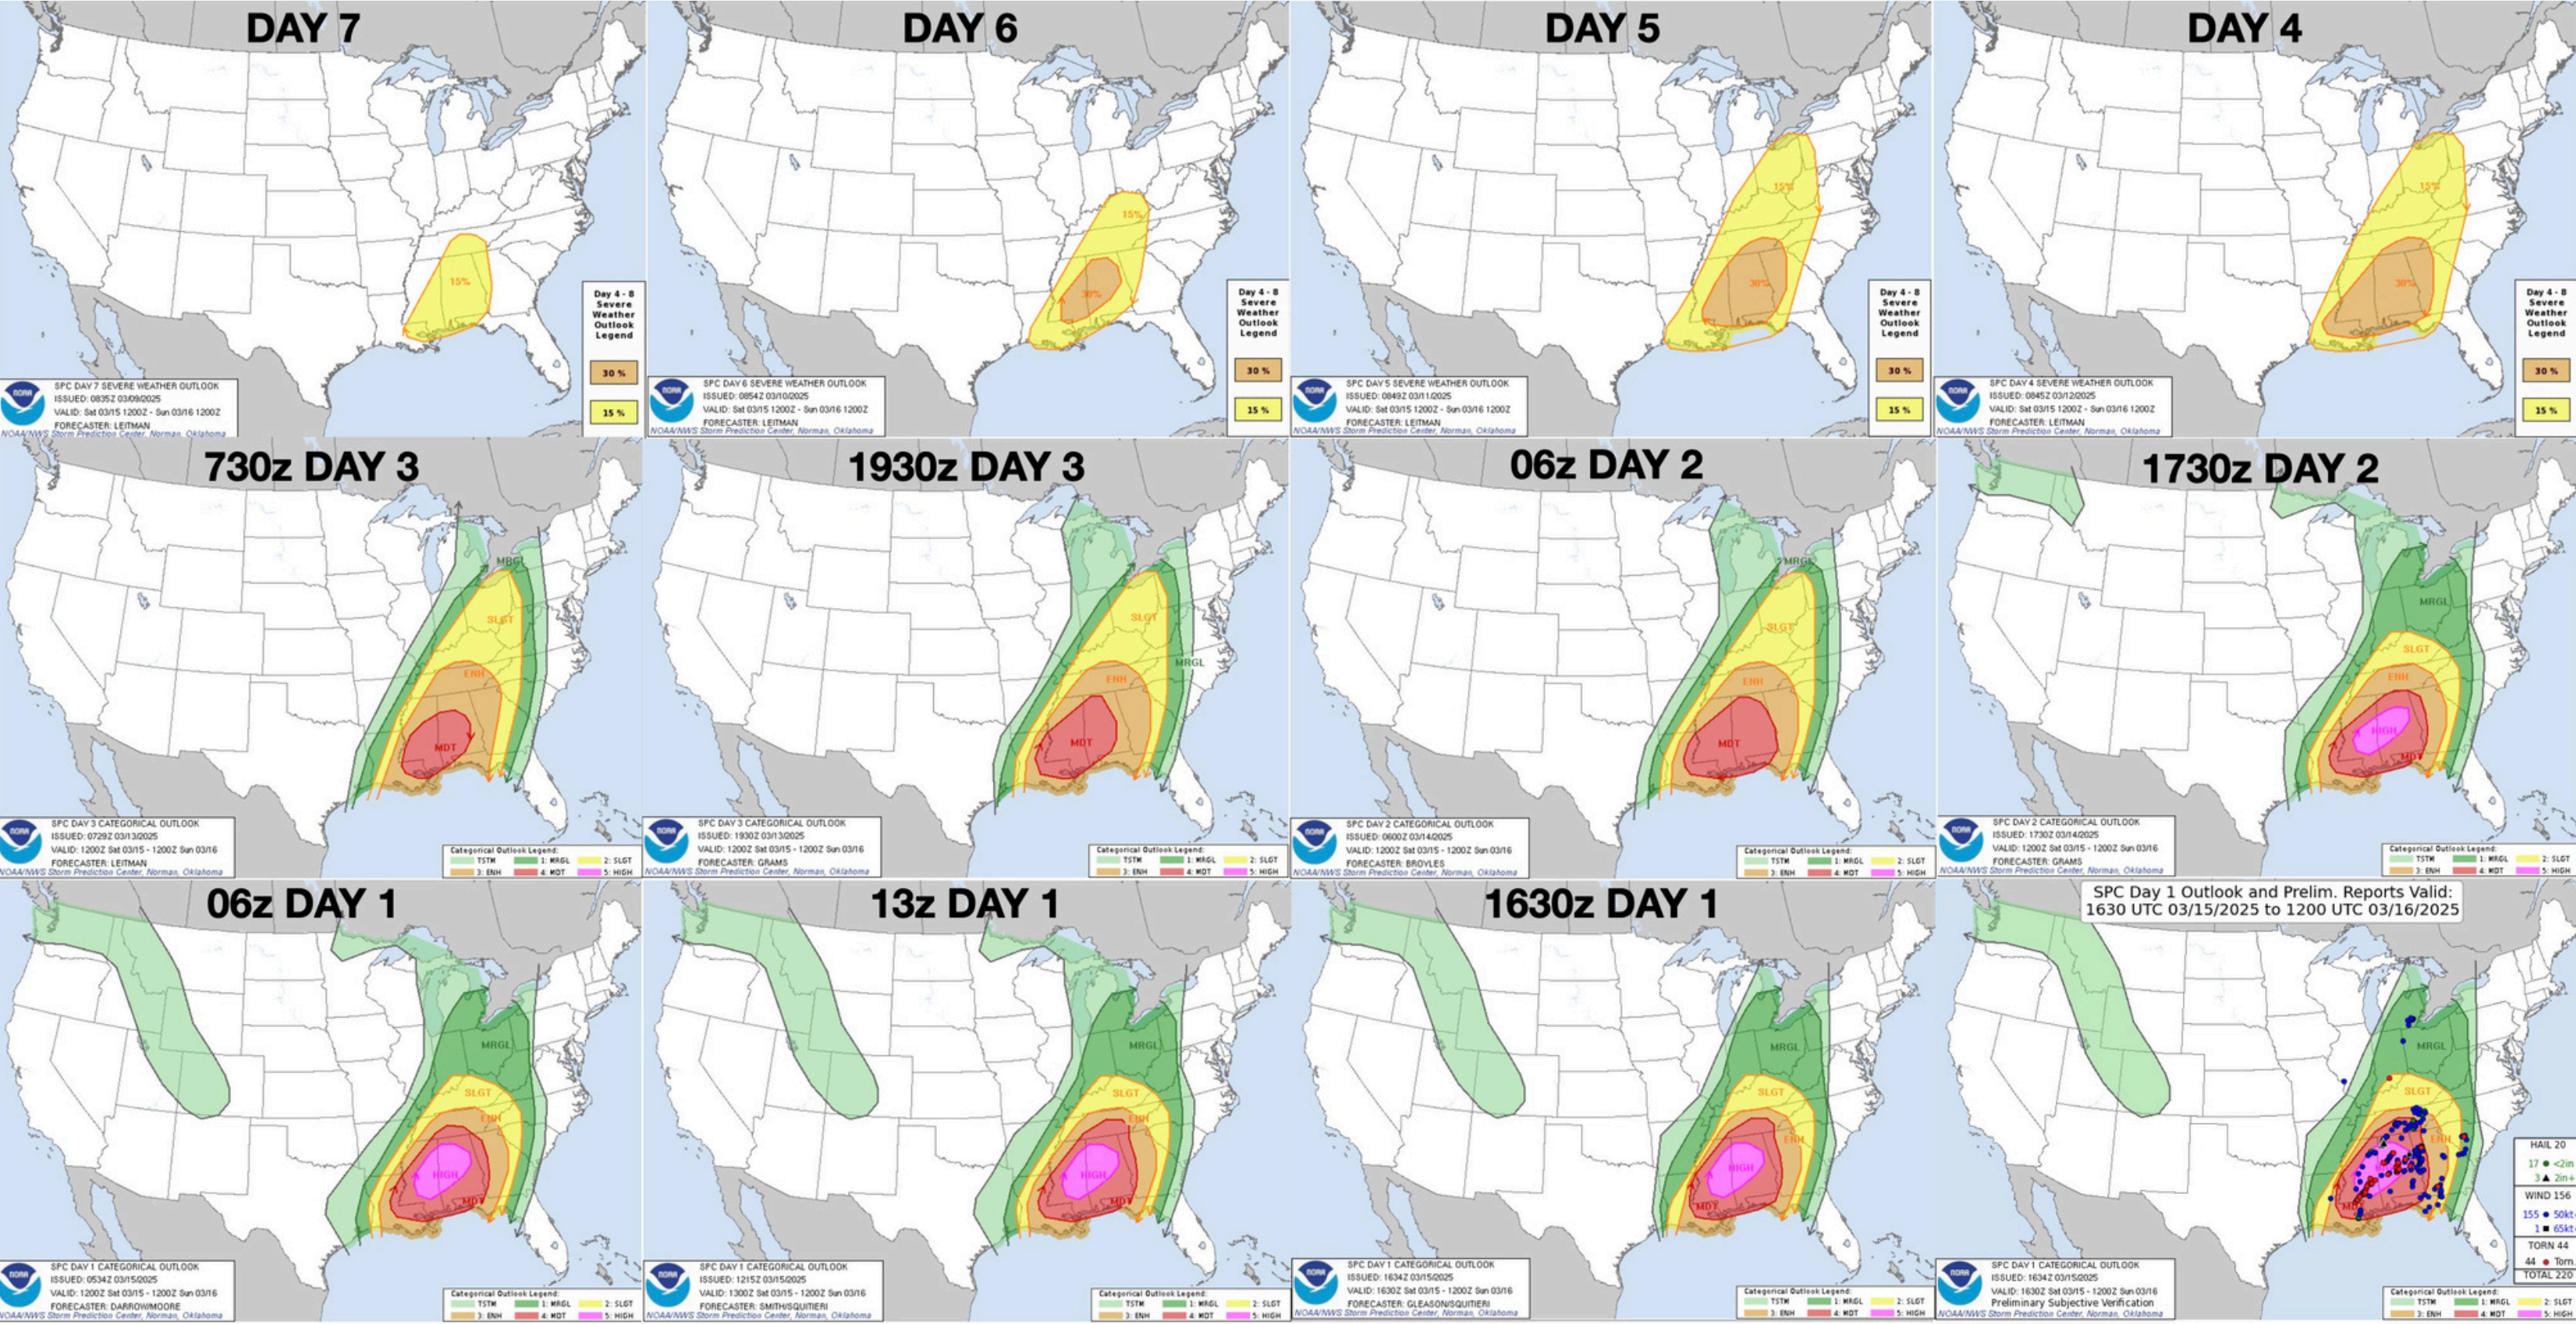

D6 MACHINE LEARNING VS SPC FORECASTER

Strengths lie in **earlier** detection and increasing confidence in severe threat across a **broad** area.
