Trees blown down in Marlow.

A potent fall storm system moved out of the Rockies and across the Southern Plains during the late afternoon and evening hours of the 12th. A strong surface low and Pacific front served as the focus for widespread thunderstorm development. Abundant moisture and strong wind shear was highly supportive of severe thunderstorms. Storms developed initially over western Oklahoma and moved eastward through the evening. Initial storms produce wind gusts of 70 to 85 mph. Storms eventually merged into a couple of north south lines, but the intensity of the storms diminished after sunset.
