	02/18/25 07:00 CST	0		Winter Weather
	02/19/25 05:00 CST	0		
A winter weather event impacted portions of the Central Plains and Ozarks from the morning of the 18th through the early morning of the 19th. A highly-amplified positively-tilted upper trough dominated much of the eastern United States. An embedded system, moving from the Front Range into the Ozarks during the period, helped to instigate widespread precipitation. Strong westerly mid-tropospheric flow helped to advect a warm/dry airmass across much of the WFO Norman area. In turn, much of the ice-initiated precipitation (snow) potential was limited throughout the day, instead focusing on precipitation generation within the saturated boundary layer (freezing rain). Widespread travel impacts occurred, especially across central Oklahoma.
