MCCLAIN COUNTY --- 7.9 SW CRINER [34.90, -97.67], 4.2 SW WAYNE [34.88, -97.37]

06/05/25 16:40 CST	1M	Thunderstorm Wind (EG 104 kt)
06/05/25 17:05 CST	0	Source: NWS Storm Survey

A wide swath of very strong thunderstorm winds moved out of Grady County and into southwestern McClain County . There was extensive damage for a distance of at least 18 miles from the Grady County line to southwest of Wayne . The width of the damage swath was up to 3.5 miles wide in the Payne area. The most significant damage and winds estimated to be near 120 mph were south of Payne along Western Avenue and along 120th Street where a well constructed barn was destroyed, numerous power poles were snapped, and trees snapped and partially debarked.

Elsewhere, power pole and significant tree damage occurred throughout this damage swath. At least six homes suffered roof damage and nine barns or outbuildings were damaged or destroyed.

There were three locations of concentrated damage within the very large damage swath that showed a somewhat convergent damage pattern where it is possible tornadoes may have occurred, but overall the evidence was inconclusive if this was a tornadic circulation or convergent winds along the front flank gust front of the supercell with a strong north component to the winds underneath the front flank core, a south component to the winds in the inflow region, and a west component to the winds in the rear flank downdraft. Overall the broad range of evidence suggests the latter, but it does remain possible that there were embedded tornadoes within this large-scale significant wind damage swath.

GARVIN COUNTY --- 2.8 WSW PAOLI [34.82, -97.31]

06/05/25 17:12 CST	0	Thunderstorm Wind (MG 61 kt)
06/05/25 17:12 CST	0	Source: Broadcast Media

Measured by a broadcast media storm chaser along Interstate 35. The location is approximate.

While the upper air pattern across Oklahoma and north Texas was benign (from a thunderstorm perspective) for much of the 5th, a cluster of occasionally intense thunderstorms tracked along a quasi-stationary boundary from the eastern Texas Panhandle through portions of western and south-central Oklahoma during the afternoon and evening hours. This activity initiated along a mid-level front within a zone of strong isentropic ascent. Thunderstorm wind damage, including a swath of significant damage across portions of southern McClain and northern Garvin Counties, and large hail were noted episodically with this activity.

<p>A swath of significant thunderstorm wind damage continued into portions of northwestern and north-central Alfalfa County on the early morning of the 7th. Multiple residences in the community of Burlington reported tree damage, including large limbs blown down with several smaller trees uprooted. Along Oklahoma Highway 8, between the communities of Cherokee and Driftwood, a large, uprooted tree landed on a house and multiple power poles were snapped, with one landing on the corner of a mobile home. Additional damage continued along the Oklahoma Highway 11 corridor northeast of the community of Cherokee. In addition to tree damage, a metal carport was vaulted and landed on the corner of a house and the bay doors of a large metal storage building were blown in. The damage path is estimated, with additional thunderstorm wind damage likely continuing eastward through the county, on the north side of the Salt Plains National Wildlife Refuge. The event time is estimated from radar observations. Damage photos were relayed courtesy of the Oklahoma Department of Emergency Management.</p>

Tipton (TIPT) Mesonet observation. Severe (>50-knot) wind gusts occurred during the event time, with the peak gust of 52 knots occurring at 0235 LST. A heat burst was likely responsible for this event.				
A multi-modal episode of severe thunderstorms occurred from the late evening of the 6th through early morning of the 7th, primarily impacting areas along the north of Interstate 40. Initial severe weather was focused along a modifying warm front, lifting northward into portions of central/west-central Oklahoma. Thunderstorms in this regime produced reports of very large hail and a few severe-caliber wind gusts. Concurrently, a long-track and occasionally tornadic supercell was moving into portions of far western Oklahoma. While no tornadoes occurred across the WFO Norman Forecast Area, this thunderstorm produced large hail in Beckham County. By the early morning of the 7th, a mesoscale convective system (MCS) organized and became well-defined/mature as it swept eastward across northern Oklahoma. Widespread and locally intense thunderstorm wind damage/gusts, and two brief tornadoes, were noted across this area.

Another episode of intense severe weather impacted much of the WFO Norman Forecast Area during the afternoon through mid-evening on the 8th. Thunderstorm activity during this episode was focused generally along and just ahead of a southeastward advancing cold front, as a strong upper trough dove across the Plains. Very strong instability and sufficient deep-layer wind shear promoted organized thunderstorm modes, with numerous thunderstorm clusters (Oklahoma) and a few intense supercells

<p>Multiple rounds of severe thunderstorm activity impacted portions of Oklahoma, mainly central and northern areas, from the morning of the 14th through daybreak on the 15th. An initial decaying complex of thunderstorms moved from southern Kansas into northern and central Oklahoma on the morning into early afternoon of the 14th. While this activity was non-severe for much of its journey across the WFO Norman Forecast Area, a brief uptick in intensity occurred after midday across southeastern Oklahoma, where sporadic damaging wind gusts and large hail were noted.</p>				
<p>While a brief lull in convective coverage occurred through the early evening, a warming airmass near remnant thunderstorm outflow across west-central Oklahoma provided focus for the development of a lone intense supercell thunderstorm. This thunderstorm impacted portions of Custer, Blaine, Caddo and Washita Counties, producing a tornado and large to very large hail. As a broader synoptic trough impinged across the region later in the evening, more widespread coverage of severe thunderstorms occurred, yielding continued large hail and thunderstorm wind damage events across central and southern Oklahoma through daybreak on the 15th.</p>

This large tornado started near the Texas state line and moved southeast through southwestern Ellis County. It was rain-wrapped much of the time, although research radars and the damage survey confirmed it's existence.

The tornado moved southeast causing extensive roof damage to a home and a barn as well as causing significant damage in groves of trees near Little Robe Creek, including snapping and debarking the trees. The tornado continued southeast and caused more extensive tree damage along County Roads D1695 and E0720. One home that had been burned in the Smokehouse Creek wildfire (February 2024) was further damaged with the tornado scattering the remnants of the house.

The tornado severely damaged more trees and downed power line along County Roads N1730 and E0730 and along the Canadian River before crossing into Roger Mills County.

In addition to a morning complex of severe thunderstorms, a multi-modal severe weather outbreak impacted portions of northern and central Oklahoma during the evening of the 17th. Initial thunderstorm coverage during the morning across northern Oklahoma featured a few reports of thunderstorm wind damage/gusts. After quickly moving eastward, allowing for substantial airmass recovery across the area, additional severe thunderstorms developed ahead of an approaching synoptic wave by the early evening. Initial thunderstorms impacted the Oklahoma/Kansas border areas of Kay County, producing a few reports of large hail. All the while, an intense supercell thunderstorm was drifting from the northeastern Texas Panhandle into portions of western Oklahoma. This storm became tornadic as it crossed into Ellis and Roger Mills County, producing a significant (EF-2) tornado here. As this thunderstorm grew upscale, along with additional development to its north, an organized mesoscale convective system (MCS) took shape. Numerous reports of wind damage and three brief tornadoes occurred as this system swept eastward across the northern one-half of the forecast area.

A relayed image shows roadway flooding in and around the community of Pauls Valley. The location and event time are approximate.				
Widespread strong-to-severe thunderstorms developed along a quasi-stationary boundary across central and southern Oklahoma and western-north Texas during the evening of the 30th. In addition to a measured severe-caliber wind gust, the combination of high moisture content in the lower atmosphere and slow-moving thunderstorms led to a few localized areas of flash flooding across southern Oklahoma.

Another episode of intense severe weather impacted much of the WFO Norman Forecast Area during the afternoon through mid-evening on the 8th. Thunderstorm activity during this episode was focused generally along and just ahead of a southeastward advancing cold front, as a strong upper trough dove across the Plains. Very strong instability and sufficient deep-layer wind shear promoted organized thunderstorm modes, with numerous thunderstorm clusters (Oklahoma) and a few intense supercells
