Purpose
_____

Technique MDRONLY sets whether MAP will be computed using only MDR
data whenever possible.

Valid values are NO (0) and YES (1).

The Global default is NO (0).

This Technique is Nonuniversal.

Form of Input
_____

MDRONLY(integer) (areas-groups)

    where integer   is 0 or 1 specifying whether MDRONLY is off or
                          on
         areas-groups specifies the areas or groups for which the
                          MDRONLY specification applies

Examples
_____

MDRONLY (A MARK1-CNUK1)

   Technique MDRONLY will be turned on when the MAP Function encounters
   area MARK1 and turned off after completing area CNUK1. If area
   CNUK1 occurs before area MARK1 in the ordered list of MAP areas then
   MDRONLY will be turned on when encountering area MARK1 but will
   never be turned off. Thus when specifying ranges for nonuniversal
   Techniques the user needs to be aware of the computational order.

MDRONLY (F SPRING)

   Technique MDRONLY will be turned on for Forecast Group SPRING.

MDRONLY(0) (A <CTWK1-EMPK1>)

   Technique MDRONLY will be turned off for areas CTWK1 through EMPK1.
   Example three in combination with example one will result in MDRONLY
   being turned on starting with area MARK1, turned off at area CTWK1,
   turned back on after completing area EMPK1 and turned off after
   completing area CNUK1.
