Purpose

Command RRSFREE analyzes the RRS primary and free pool files in the
Preprocessor Data Base and prints the following information:

  o the number of RRS stations that have free pool chains

  o the number of free pool records currently belonging to chains

  o a list of all the RRS stations that have free pool chains and the
     record numbers of the free pool records that make up those chains

Warning messages are printed if:

  o any free pool chain ends with a record marked not active

  o any free pool records marked as in use do not belong to free pool
     chains

  o any free pool records belong to more than one chain

These problems can arise if a job is terminated abnormally or while
writing RRS data or if multiple jobs attempt to update freepool
records at the same time.

Input Data

   Card   Field   Format   Contents

    1   1   '@RRSFREE'

            2   'RLSE'   1/

            3   'DETAIL' 2/

Notes:

1/ Field is optional. If specified any free pool records marked in
   use but not part of a chain will be released.

2/ Field is optional. If specified a listing of all freepool chains
   will be printed.
