VIII.2 DESCRIPTION OF FORECAST COMPONENT INTERNAL ARRAYS

This Chapter describes the internal arrays used by the Forecast Component for a Segment.

Arrays C, ${\rm P}$ and T arrays contain information for the Operations used in the Segment.

Array C [<u>Hyperlink</u>] contains carryover data for the Operations that have carryover.

Array P [Hyperlink] contains parameters for each Operations.

Array T [Hyperlink] contains the Operations Table for each Operation.

Array TS [<u>Hyperlink</u>] contains information about the time series used by the Segment.

Array D [<u>Hyperlink</u>] contains time series data during the execution of the Segment.

Information is stored in arrays C, P, T and TS by the Forecast Component Initialization Program (FCINIT) [<u>Hyperlink</u>] which writes them to the Forecast Component Data Base [<u>Hyperlink</u>].

The D array is not stored in a file and used to store data during the execution of the Segment and to provide work space during both initialization and execution.
