Description

Subroutine FINICO initializes variables, arrays and temporary files needed to save carryover during a carryover save run.

Checks are that all previously defined items are valid and that the carryover save dates are not in violation of any rules. Slots on the permanent carryover file are then chosen for updating the file.

The carryover slots on the permanent files are allocated using the following rules:

   o use a slot with the same date and time as the requested save date

   o use the oldest volatile slot

   o use the oldest incomplete protected slot

The slot information, the protection status flag, the carryover group identifier and the carryover save date and time are then written to the first record of all the temporary files needed for saving carryover.

Calling Sequence

CALL FINICO (ID)

Argument List

Argument	Input/ Output	Type	Dimension	Description
ID	Input	A8	1	Carryover Group identifier
