Condensed Climate Normals and Extremes	145

Climate of Portland

I. Revision Notes.

This revision of the Climate of Portland includes data through 2023. In addition a few corrections may have been made to data. Full listing of such are listed on the page located before table of contents section.

Portland weather records began in the 1870s, but the records used are often for the main observing site. For Portland, this would be the Portland International Airport (PDX), where weather observations have been continuous since October 1940. Prior to October 1940, weather records were taken at various locations in and near downtown Portland.

II. Geographical Overview.

Portland is situated at roughly twenty feet above sea level near the confluence of the Willamette and Columbia River, about 65 miles inland from the Pacific Ocean. Portland lies midway between the Coast

Range to the west and the high Cascades Range to the east, each about 30 miles distant. The skyline is dominated by two volcanoes: Mount St. Helens (8300 feet high) 40 miles northeast, and Mount Hood (11,385 feet) 40 miles east.

Portland is also located at the northern end of the Willamette River Valley, a rich and diverse agricultural region. The long growing season and mild temperatures are favorable for a diversity of agricultural products.

During the summer, irrigation is widely used to raise cannery crops, berries and hay. Table beets, green beans, sweet corn, carrots, and pumpkins are grown in large quantities, then processed at the many processing centers in the Willamette Valley. Peaches, pears, cherries, plums and berries are also canned, with cherries and pears being the most numerous. Other major agricultural crops include apples, prunes, peppermint, spearmint, grass and grass seed, flowers, trees and shrubs, tomatoes, cucumbers, hazelnuts, and grapes (mostly used in wine production).

III. Climatological Summary.

The Coast Range provides the Portland area limited shielding from the Pacific Ocean storms. The Cascades offer a steep slope for orographic lift of moisture-laden westerly winds, resulting in moderate rainfall for the region. The Cascades also act as a barrier, preventing the colder continental air masses that originate in the arctic areas of Canada, from invading western Oregon. Occasionally, however, cold air does work its way into western Oregon through the Columbia River Gorge, which lies east of Portland.

Rain is a part of life during the winter months. Nearly 90 percent of the annual rainfall

occurs between mid-October and mid-May. In fact, only about 3 percent of our rain occurs in July and August. It is not uncommon to see relatively dry summers in Portland. Rain varies across the Portland metropolitan area. The West Hills receive 60 inches of rain per year, but the airport only receives about 35 to 37 inches (*see figure 2*).

Precipitation falls mostly as rain, with an average of only four days per year recording measurable snow. Snow accumulations are rarely more than two inches, and often melt within a day. Most likely areas of snow will be the higher terrain above 500 feet (which includes the West Hills), or near the Columbia Gorge at Troutdale, located on Portland's east edge.

The winter season is characterized by mild temperatures, cloudy skies, and rain. Winds are predominately either southerly during the mild rainy spells, or easterly during the colder dry spells. Outbreaks of cold arctic air from east of the Cascades will occasionally spill into Portland, bringing cold blustery east winds. If the east winds occur when the rain is falling over the metropolitan area, a shallow layer of sub-freezing air forms along the Columbia River. In this cold layer, freezing rain and even snow at times will occur over eastern and northern Portland.

The cold easterly winds also bring the coldest air of the year to Portland. Temperatures below zero degrees are rare, occurring only six times since 1871. Most temperatures during the winter reach the 40s and lower 50s in the daylight hours, then fall into the 30s at night.

Spring is a transitional time as the weather pattern shift from winter to summer. However, spring is not all that warm, and often, not all that dry. March and April are often damp and cool, with only a few warm

dry days. May and June turn more dry, and see the most of the warming weather. Generally, afternoon temperatures warm from the 60s/70s in May to the 70s/lower 80s in June. However, it is not uncommon to see temperatures into the 80s or 90s. Memorial Day 1983 saw 100 degree heat! Even though the number of rainy days decreases in May and June, there are still plenty of cloudy days.

Summer finally arrives in early July, when afternoon highs in the 80s occur with regularity. High pressure over the Pacific builds in the summer, with northwesterly winds prevailing in the afternoons and evenings. This high also shuts off the moisture source, allowing summers to often be dry and warm. Temperatures will often reach the lower to middle 90s, but these warm days do not last long before the cooler ocean air moves inland and cools the region back into the 70s. Temperatures above 100 degrees are rare, but usually occur in July and/or August.

Figure 2 : Portland-Vancouver metropolitan area.

Autumn is the reverse of spring. September is still warm and dry, but by early to mid-October, fall arrives with high temperatures back into the 60s. As the night time hours increase, the valley cools more, allowing fog to form on clear nights. Fog can be quite dense during the late night and early morning hours, and can persist for several days.

Destructive storms are rare in Portland. Surface winds seldom exceed gale force (50 mph or greater) and have rarely exceeded 75 mph. Thunderstorms can occur during any month, but are not common. Thunderstorms in the winter and spring are weak, producing small hail and brief gusty winds. However, those in summer can produce prolific lightning, strong winds and large hail. Occasionally, thunderstorms will produce funnel clouds, but tornadoes are rare. The most famous tornado occurred on 5 April 1972. It produced \$4 million damage, killed 6 persons, and injured over 300 people as it scoured across north Portland into Vancouver.

On average, the last occurrence of 32 degrees in the spring is March 30th, while the first of the fall occurs around November 8th. First frost of fall is often in late October, while the last frost of spring does not occur until mid to late April. This makes for a long growing season.

IV. Station Observing History.

Official weather records for Portland began on November 1st, 1871 when the Signal Corps of the United States Army established a station in downtown Portland. Prior, weather records were fragmentary. The Signal Corps took weather observations until the end of June 1891. On July 1st, 1891, the weather observations and meteorological work of the federal government was taken over by the newly formed United States

Figure 3: Portland's official observation sites. Various downtown sites (1871-1928), the Swan Island Airport (1928-1940), and finally, Portland Int'l Airport (1940-present).

Weather Bureau, under the Department of Agriculture (*in 1940, the Weather Bureau was transferred to the Department of Commerce*).

On November 1st, 1871, the first weather station was established in the Gilman Building, located at what is presently the corner of SW First Avenue and Alder Street. Nearly a year later, on December 21st, 1872, the weather station was moved to the Parish Building, located at Front Avenue and Washington Street.

Several years later, on January 1st, 1878, the station moved again, this time to the Oregon and Washington Trust Company's bank building at 48 (old city numbering) SW First Avenue. On August 1st, 1885, it moved to the Kamm Building at SW First and Pine. However, on October 5th, 1892, a fire in the Kamm Building forced another move to the Oregonian Building at SW 6th and Alder.

Finally, on June 8th, 1902, the weather station moved to the United States Customs House at 220 NW Eighth Avenue. Figure 3 shows the various observations sites since 1871.

At first, the thermometers were mounted in a shelter attached to a north window, but when the move was made to the Kamm Building, the shelter was placed on the roof, and subsequent downtown sites placed the shelters on rooftops. Throughout the period of record, the rain gauges have also been on the roofs. Table below shows the elevation of the roofs above ground level.

<u>Building</u>	<u>Height of Roof</u>
Parish Building	47 feet
Oregon/Washington Trust	51 feet
Kamm Building	76 feet
Oregonian Building	196 feet
U. S. Customs House	63 feet

A self-recording weighing rain gauge was installed on February 11th, 1890. It was replaced by a bucket-type gauge on June 8th, 1902. Exposure of wind instruments was similar to that of the rain gauges, only set ten feet higher.

Self-registering thermometers, which indicate the daily maximum and minimum temperatures, were installed in July 1874. A thermograph was installed in June 1888, allowing a continuous record of temperature data. Recorded relative humidity began in January 1872, while a sunshine recorder arrived in January 1891.

On July 16th, 1928, the Portland Airport opened near what is presently the Swan Island Shipyards. The need for aviation weather support prompted a move of the downtown weather office to the new airport. Pilot weather briefings became a high priority of the new weather office. The weather recording instruments were moved

to the roof of the Swan Island administration building.

On September 30th, 1940, the weather stations moved again. This time, to the new Portland International Airport, located 9 miles northeast of downtown Portland on the south of the Columbia River. At this location, the thermometers and rain gauges were placed at ground level. The wind instruments were placed on the roof of the United Airlines hangar until February 1st, 1949, when they were moved about 250 feet west of the hangar to the roof of a service building.

During the summer of 1948, the famous Vanport flood occurred. It was the greatest flood on the Columbia River since 1894. Heavy rainfall and a large snowmelt had swollen the Columbia River, eventually collapsing a river dike near Vanport, presently known as the Delta Park area. The flood waters inundated the town of Vanport and the river valley for over 40 days, forcing the weather office to temporarily relocate to the Customs House in downtown Portland. The office returned to operations at the airport in August 1948.

In July 1994, the forecast office moved to NE 122nd Avenue, about 5 miles east of the airport. However, the observations continued at the airport location. On November 1st, 1995, ASOS (Automated Surface Observation System) became operational.

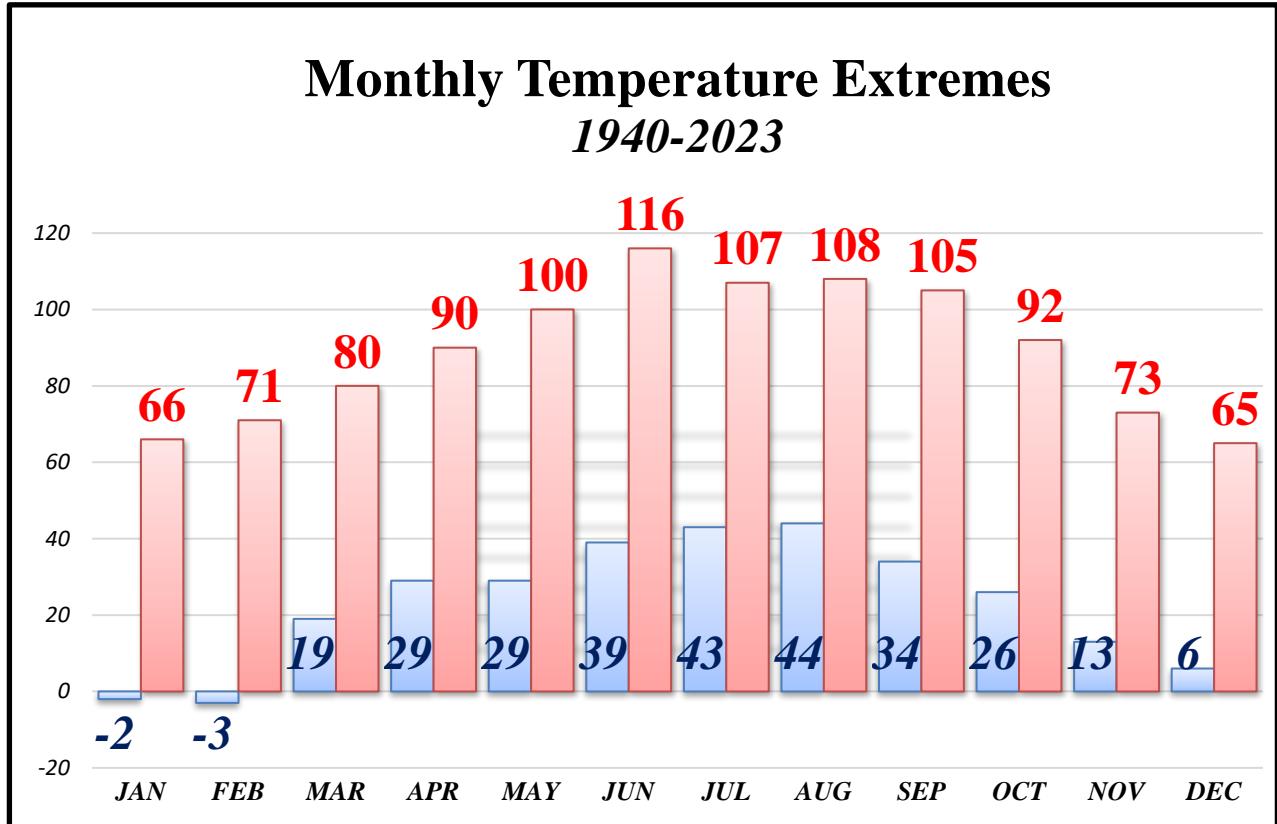

V. Updating this Study.

For future updates to the data in this study, refer to the latest climatic data published by the National Climatic Data Center, or contact the National Weather Service in Portland.

Portland data is also available on our website:

¹ Airport Normals are the 1991-2020 normals.

² Mx is maximum temperature; Mn is minimum temperatures; HD is heating degree days; CD is cooling deg. days.

³ HD and CD monthly averages are based on actual monthly occurrences, rather a sum of daily values.

Cumulative Frequency of MAXIMUM/MINIMUM Temperatures

(1940-2023 data from Portland Airport)

How to use tables:

- 1) In May, 23% of all days have a high (max) temperature of at least 75°
- 2) In January, 74% of all days have a low (min) temperature colder than 40°.

Max T	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC	YEAR

2001-2030													

¹1921-1950 30-year normals derived only using the actual observation taken (1940-1950).²Normals 1971-2000 recalculated using same methodology as that of the 1981-2010 as well as current 1991-2020 normals. This process yields more realistic normals for 1971-2000.

1) NOR are the 1991-2010 Climate Normals.

2) **Annual averages calculated by using average of the monthly data values, rather than using the all daily values (this method is recommended by NOAA's National Climate Data Stewardship Team).**

Progression of Portland Airport's 30-Year Climatic NORMALS for MIN Temperatures

period	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Year

2001-2030													

¹1921-1950 30-year normals derived only using the actual observation taken (1940-1950).

²Normals 1971-2000 recalculated using same methodology as that of the 1981-2010.

This process yields more realistic normals for 1971-2000.

2001-2030													

¹1921-1950 30-year normals derived only using the actual observation taken (1940-1950).²Normals 1971-2000 recalculated using same methodology as that of the 1981-2010.

This process yields more realistic normals for 1971-2000.

AVG¹	2 Apr	17 Oct	8 May	28 Sep	18 Jun	6 Sep	21 Jul	31 Jul								

¹AVG is period of record (1941-2023) average occurrence of the temperature, if it occurs (as is case with 100°)

AIRPORT Portland: HEATING DEGREE DAYS

What are Heating Degree Days? Heating Degree Day (HDD) units are used by utility companies and other institutions for determining energy consumption. The heating season is July 1st through June 30th.

How are Heating Degree Days calculated? Calculate the mean temperature for the day (*maximum and minimum added, then divide by 2*), then subtract this mean from 65 (*baseline value*). All negative values are recorded as a zero. Monthly and seasonal values are sums of the daily values for that period.

Example: Max Temp: 57 Mean Temp = $(57 + 35) \div 2 = 46$
 Min Temp: 35 HDD for the day = **65 - 46 = 19 (rounded)**

¹Last year of multiple occurrences. Departure from normal is from the appropriate normal for that time frame.

AIRPORT Portland: COOLING DEGREE DAYS

What are Cooling Degree Days? Cooling Degree Day (CDD) units are used by utility companies and institutions for determining energy consumption. The cooling season is January 1st to December 31st.

How are Cooling Degree Days calculated? Calculate the mean temperature for the day (*maximum and minimum added then divide by 2*) then subtract 65 (*baseline value*) from this value. All negative values are recorded as a zero. Monthly and seasonal values are sums of the daily values for that period.

Example: Max Temp: 94 Mean Temp = $(94 + 63) \div 2 = 78.5$
 Min Temp: 63 CDD for the day = $78.5 - 65 = \boxed{14}$ (rounded)

¹Last year of multiple occurrences. Departure from normal is from the appropriate normal for that time frame.

DOWNTOWN Portland: FREEZE DATA

To calculate Freeze Free period: Subtract the Julian date of day prior to the first freeze in autumn from the Julian day of the last freeze of spring (leap years add 1 day if spring freeze is after 28 Feb).

table format: date of occurrence (month.day) that day's minimum temperature and Julian (J) day

¹ Normals listed are climatic normal (1991-2020). Daily and cumulative averages are based on a daily value that is computed from normalizing the monthly total across the days of a month.

² Last year of multiple occurrences listed. For snow, if never occurred on that day, will have 0 in amt and a - (dash) in year.

¹ Normals listed are climatic normal (1991-2020). Daily and cumulative averages are based on a daily value that is computed from normalizing the monthly total across the days of a month.

² Last year of multiple occurrences listed. For snow, if never occurred on that day, will have 0 in amt and a - (dash) in year.

DECEMBER: Daily Precipitation Normals & Records

DY= Daily, MO= Month to Date, YR= Year to date, WY= Water Year to date. Precipitation in units of inches

¹Snowfall measurements at PDX ended in 1996. Afterwards, snow measured at the NWS Office on NE 122nd.

²Occurred often, most recent year of occurrence listed.

³Potential issue with snow amount, as was likely higher due to under-measurement during strong east winds. More likely, is that 6 to 10 inches fell. But, for now, will keep as 3.6 inches for official snowfall, as is published with NCDC/NCEI.

Christmas Snow in Portland

A Christmas with snow is a rare event in the Portland area. Between 1940 and 2023, only two years (2008 and 2017) stands out as a truly ‘white, snowy’ Christmas. To be a white Christmas, snow must be falling and accumulating, or snow still remains on the ground Christmas morning.

Following is a summary of snow data for both Christmas Eve and Christmas Day. Bold numbers in the box indicate the probability of receiving at least a trace of snow on Christmas Day.

AIRPORT 1940-2023			<i>Chance of Snow on Christmas at Airport</i>			1%

F is the frequency, or number of times measurable snow occurred on that date.

% is the frequency, as a percentage. For example, snow fell on Dec 13th 6 times, or on 4% of all Dec 13ths.¹ Airport probabilities/frequencies include airport site (1940-1995) supplemented by forecast office (1996-2023)

Data coverage: 1884-2023 for Downtown, and 1940-2023 for Airport.

Page left blank for notes:

Pressure and Wind Data

For the Portland International Airport (Oct 1940 through 2023)

Strongest Sustained Wind Speed	South at 88 mph	12 Oct 1962
Strongest Wind Gust	South at 104 mph	12 Oct 1962 <i>wind equipment failed after that gust</i>
<i>Highest Barometric Pressure</i>	30.90 inches	1 Feb 1982
<i>Lowest Barometric Pressure</i>	28.71 inches	12 Dec 1995

For the Downtown Portland Area (1872 to 2023)

<i>Strongest Wind Gust in Portland</i>	South at 116 mph	12 Oct 1962
	<i>recorded on Morrison Street Bridge</i>	
<i>Lowest Barometric Pressure</i>	28.56 inches	9 Jan 1880
<i>Highest Barometric Pressure</i>	30.84 inches	2 Feb 1880

¹Sustained wind listed as the fastest mile speed in a minute, while gusts are instantaneous, usually 2 seconds.

²Gust of 104 mph is estimated. Official gust of 86 mph just as wind equipment lost power. On site weather observer using nearby anemometer estimated gust of 104 mph occurring about 1 hour after power failure at NWS office on Marine Drive. An official gust of 116 mph was measured in Portland on the Morrison Bridge. KGW (downtown Portland) measure 93 mph.

³Gust of 62 mph was measured by ASOS during the 12 Dec 1995 storm. Unofficial 74 mph gust measured by an onsite anemometer. Previous record (2nd strongest gust in December) is South at 72 mph on 17 December 1957.

Top 5 Days with Strongest Wind Gusts (*mph*)

(Data 1949-2023. Due to complexity of record keeping, only have strongest peak gust for each day)

³Most recent year of multiple occurrences with that speed (not necessarily the same direction).

Frequency¹ of Wind DIRECTION, based on Time of Day

How to use this table: For July, the wind at 1300 LST (1 pm) is from the NW about 22.5% of the time. Using the table from the next page, the average wind from the NW at that time is 7.7 knots, or 9 mph.

¹Data based on hourly observations between 1948 and 1995. Values may not equal 100% due to rounding.

Frequency¹ of Wind SPEED, based on Time of Day

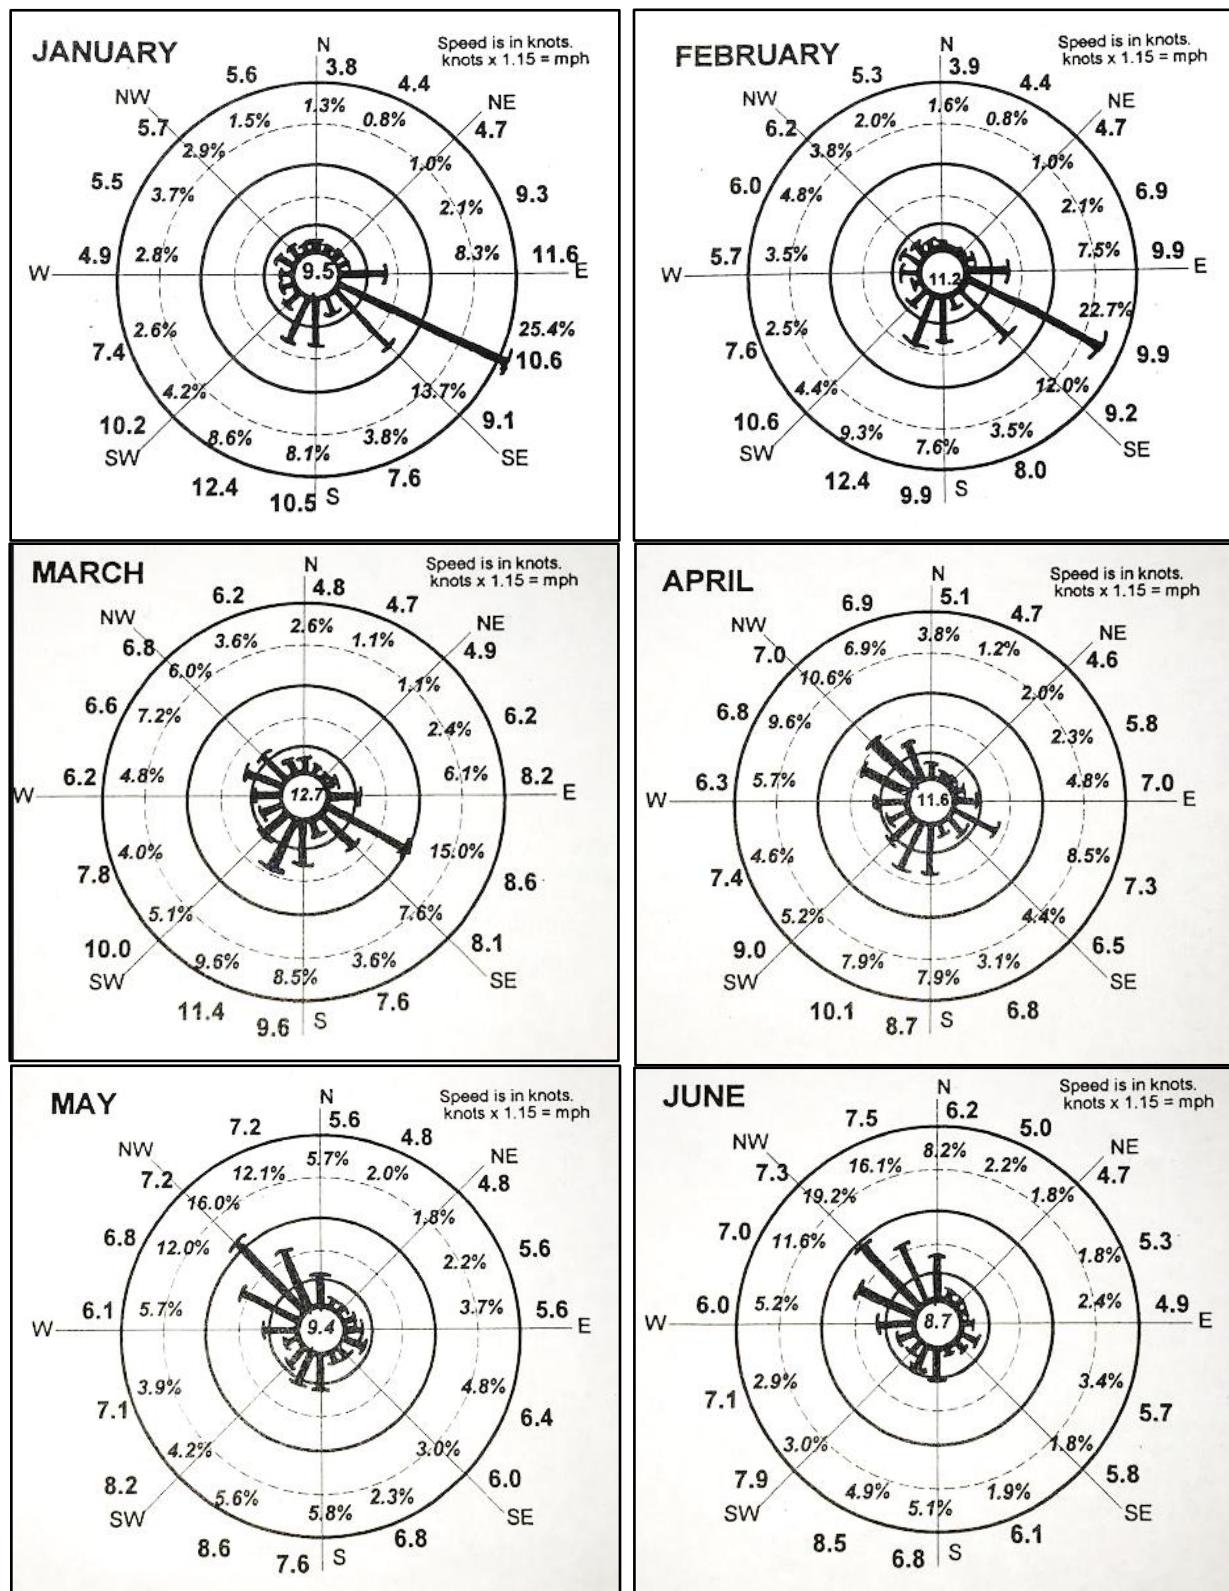

How to use this table: In May, at 1900 (7 pm local), if wind is from NW, the average speed is 9.3 kt (~11 mph). In December, at 1300 (1 pm local), if the wind is from the East (E), the average speed is 12.7 kts (~15 mph).

¹Data based on hourly observations between 1948 and 1995.

Portland Wind Roses

A wind rose indicates the percentage of time that the wind is from a particular direction, and the average speed from that direction. Each concentric circle represents a five percent interval, starting from zero at the center and ending with 25 percent at the outer circle. The value shown in the center of the inner circle is the percentage of time that the wind is calm. All speeds are in knots (multiply knots by 1.15 to get mph). Ex: In January, wind is south 8.1% of the time, with an average speed of 10.5 knots, or 12 mph.

Frequency of Portland's Wind Direction¹ as compared to Weather Conditions

Using this chart: Each direction totals ~100%. Within that direction are the frequencies (%) of weather (- indicates less than 1%).

Example: In January, when wind is from the south (S), it rains 16% of the time, but has no weather occurring 66% of time.

Example: In December, best threat of snow occurs with a southwesterly to westerly wind (snow averages 3% of all weather observations). A similar trend exists in November, but snow accounts for much less of the observations.

¹VRB is variable (less than 3 mph). A - (dash) is value that is near zero. Based on 1948-1995 observational (non-ASOS) data. Numbers total may not equal 100%, as not all weather was included (such as blowing snow, hail, dust, smoke and haze).

Portland Airport: Observed Weather Type Frequency¹

Portland's hourly observations (1948-1995, pre-ASOS data) were categorized into groups of time. For example, at 10 am in January, snow was observed 4% of the time, with rain 23% of the time, and fog 20% of the time. Overall, at 10 am in January, there was an obstruction to visibility 23% of the time.

FG Fog

SN Snow and/or Sleet

RA Rain and/or Drizzle

TS Thunderstorms

VO Any obstruction to visibility, including rain, fog, snow, smoke, and blowing snow

	20 days	1983	October 13-
	8-10 days	<i>common occurrence during autumn and early winter</i>	

⁴Fog only needs to occur on the day, and may not necessarily last the entire day.

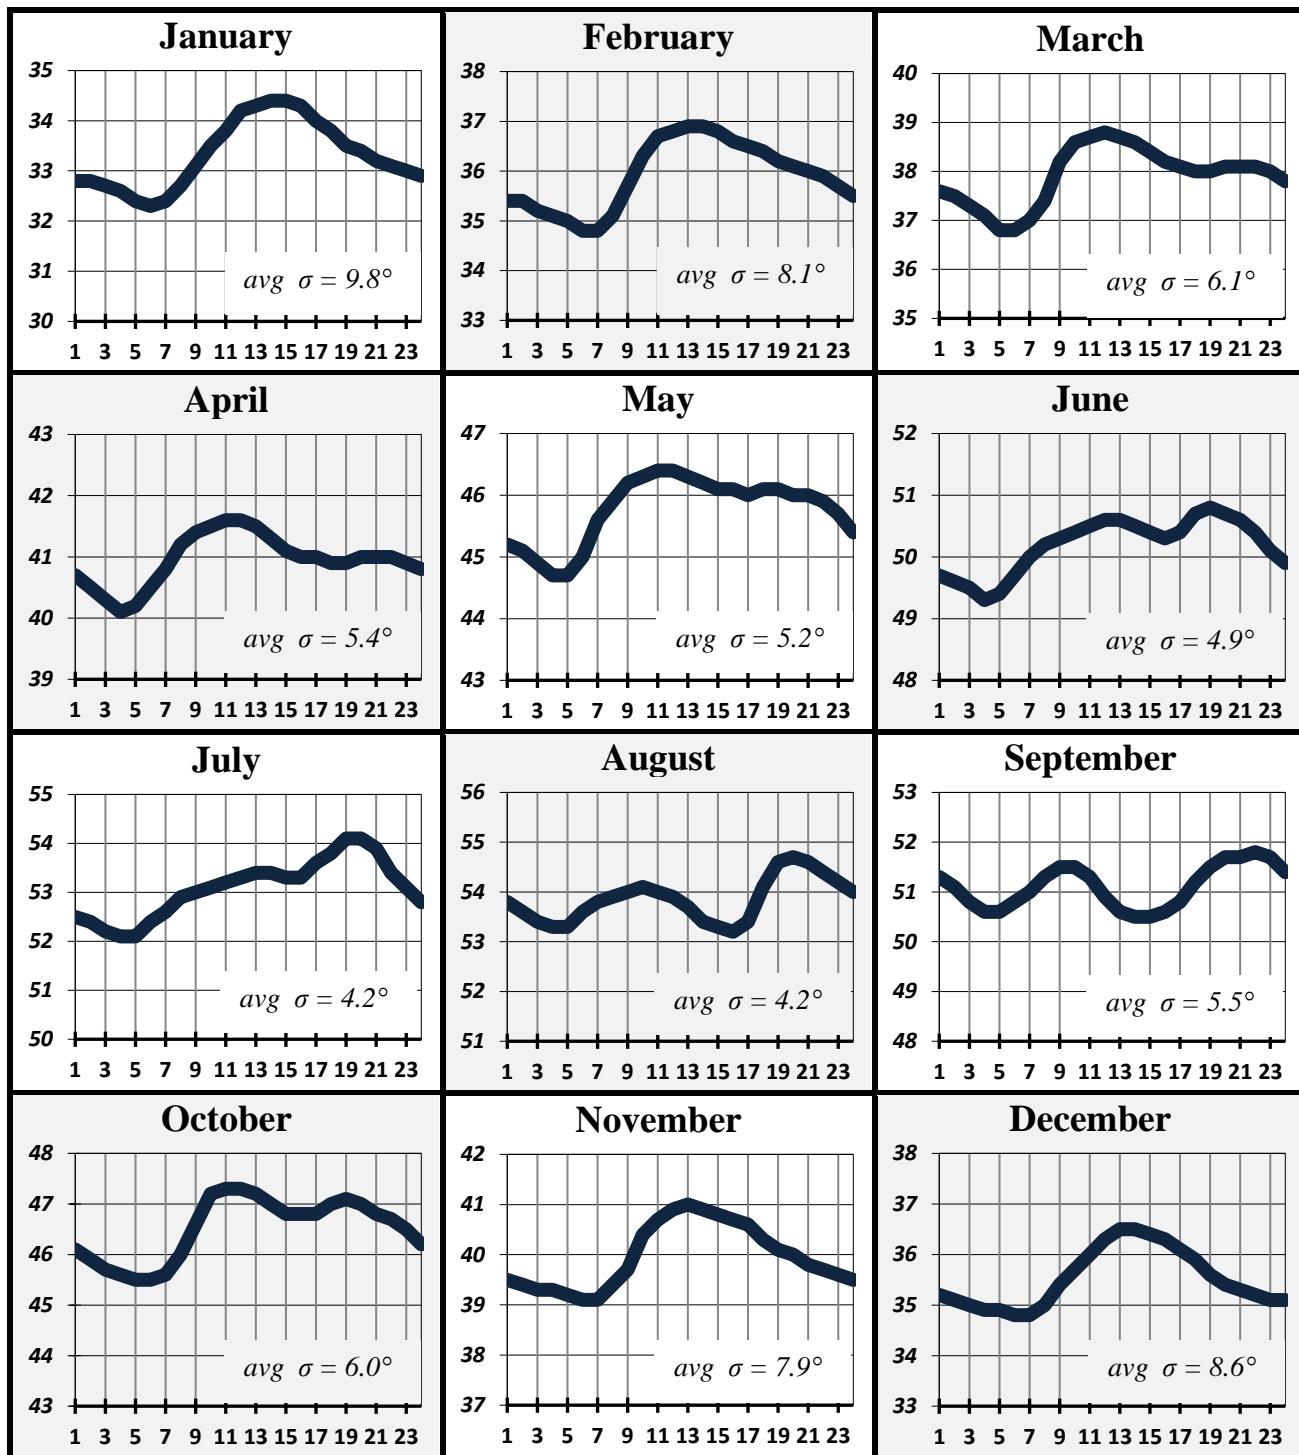

PORTRLAND: Average Hourly Humidity (%) Curves, by Month¹

Example: normal humidity at 1 pm in January is ~75%, while same time in July it is ~47%.

¹Time is local standard time.

PORLAND: Average Hourly Dew Point Temperature Curves, by Month¹

¹Time is local standard time. Shown also is the standard deviation for that month's data..

There is a diurnal trend of a rising dew point temperature during the morning, then a slow gradual fall during the afternoon into evening. Interestingly, this trend is interrupted during the summer months, with a jump during the evening. This jump coincides with an increase of northwesterly winds as onshore flow up the Columbia River brings marine air from the coast into the Portland/Vancouver area.

Cloud Cover Frequency

These are Portland's month's hourly observations (1948-1995), categorized into groups of coverage. For a specified hour, cloud cover coverage is either clear, scattered or broken clouds, or overcast. For example, at 7 am in March, 6.3% of the time it was clear skies, but 65.9% of the time, skies were overcast.

CLR	Clear skies	<i>Clear</i>	Less than 10% of sky is covered by clouds
SCT	Scattered clouds	<i>Partly Cloudy</i>	10% to 60% of sky is covered by clouds
BKN	Broken clouds	<i>Mosily Cloudy</i>	60% to 90% of sky is covered by clouds
OVC	Overcast	<i>Cloudy</i>	More than 90% of sky is covered by clouds

Portland Rose Festival: Grand Floral Parade Weather

The annual Grand Floral Rose Parade started in 1907, and is usually in early June. Weather can be fickle, ranging from warm sunny days to cool damp days. The 1980 Parade was particularly troublesome for the Rose Festival, as city streets had to be washed of the ash from the 18 May eruption of Mount St. Helens.

Averages:	Temperature at start of the parade....	61° F (<i>afternoon high 70°</i>)
	Parade Time Wind...	NW 6 mph
	Parade Time Relative Humidity...	65-70%

Warmest Parade Day... 1963 & 2003, with afternoon high temperature of 93°
Warmest Parade Start... 15 June 1963, with 75° at parade start

Coolest Parade Day... 12 June 1943, with afternoon high temperature of 55°
Coolest Parade Start... 10 June 2000, with 52° at parade start

Wettest Parade... 9 June 1950, when 0.57 inch of rain fell

Breakdown of Parade Day High Temperatures and Rainfall (1904-2023)

< 50°	in 50s	in 60s	in 70s	in 80s	≥ 90°
0 days (0%)	7 days (6%)	53 days (46%)	38 days (33%)	13 days (11%)	2 days (2%)
No Rain	Trace	≥ 0.01"	≥ 0.10"	≥ 0.25"	≥ 0.50"
61 days (53%)	8 days (7%)	44 days (38%)	27 days (23%)	10 days (9%)	1 day (1%)
