

# National Blend of Models v3.2: DAS

Jeff Craven, David Rudack, and Robert James  
NOAA/NWS/OSTI/MDL/SMB

SAWS 8 Jun 7, 2019

# Outline

- NBM Digital Aviation Services products
- NWP components and expert weights
- Techniques and Verification
- Example products
- Potential future probabilistic capabilities

# Outline

- **NBM Digital Aviation Services products**
- NWP components and expert weights
- Techniques and verification
- Example products
- Potential future probabilistic capabilities

# Suite of 65 NBM products produced

31 different NWP and MOS inputs from 5 different centers {NCEP, CMC (Canada), FNMOC (Navy), ECMWF, BoM Australia}

Temperature	Moisture	Precipitation	Wind	Winter	Fire Weather	Aviation	Marine
Temperature (Temp)	Relative Humidity (RH)	QPF 1 hour	10-m wind	Snow Amount, 1 hour	Haines Index	Sky Cover	Sig Wave Height
MaxT	MaxRH	QPF 6 hour	10-m wind gust	Snow Amount, 6 hour	Fosberg Index	Ceiling	Freezing Spray
MinT	MinRH	QPF 12 hour	30-m wind	Snow Amount, 24 hour	Solar Radiation	Visibility	Sea Ice Concentration
Apparent Temp	Dew Point Temperature	QPF 24 hour	80-m wind	Ice Amount, 1 hour	Mixing Height	Lowest Cloud Base	PMSL
Water Temp		Precipitation Duration		Ice Amount, 6 hour	Transport Wind	Echo Tops	
		PoP01		Ice Amount, 24 hour	Ventilation Rate	VIL	
		PoP06		Conditional Probability of Snow	Prob Dry Thunder 3 hour	Max Hourly Reflectivity	
		PoP12		Conditional Probability of Rain		LLWS Speed	
		Predominant Weather		Conditional Probability of Sleet		LLWS Height	
				Conditional Probability of Freezing Rain		Elrod CATurb	
				Conditional Probability Refreeze Sleet		MtnWaveTurb	
				Probability of Ice Present		MUCAPE	
				Max Wet Bulb Temp Aloft		Prob Thunder 1 hour	
				PosEWarmLayer (Bourgouin)		Prob Thunder 3 hour	
				NegEColdLayer (Bourgouin)		Prob Thunder 12 hour	
				SnowLevel			4
				SnowLiquidRatio			

# NBM runs every hour

- Just like LAMP and HRRR/RAP
- Time of Day notation: 12z NBM does not have any 12z guidance in it
- 12z NBM (example) has 11z GLMP, 10z HRRR and RAP, 06z NAMNest, etc

# NBM v3.2 Aviation core elements

- 10-m wind speed and direction
- 10-m wind gust (top of hour)
- Sky Cover
- Ceiling
- Visibility
- Lowest Cloud Base (Cloud Base Primary)

*NOTE: All at 2.5km resolution in CONUS*

# NBM v3.2 Aviation - others

- LLWS Speed and Direction
- LLWS Height
- 30-m and 80-m wind speed
- Echo Tops
- Max Hourly Reflectivity
- VIL
- Elrod Index Turbulence (300-400 mb)
- Low Level Mountain Wave Turbulence
- Prob Thunder 1, 3, and 12 hour

# NBM v3.2 Aviation - even more

- SBCAPE (Surface based)
- Snow Level (0.5C Wet Bulb height AGL)
- SnowAmt01
- IceAmt01
- QPF01
- Prob Snow, Freezing Rain, Sleet
- Predominant Weather

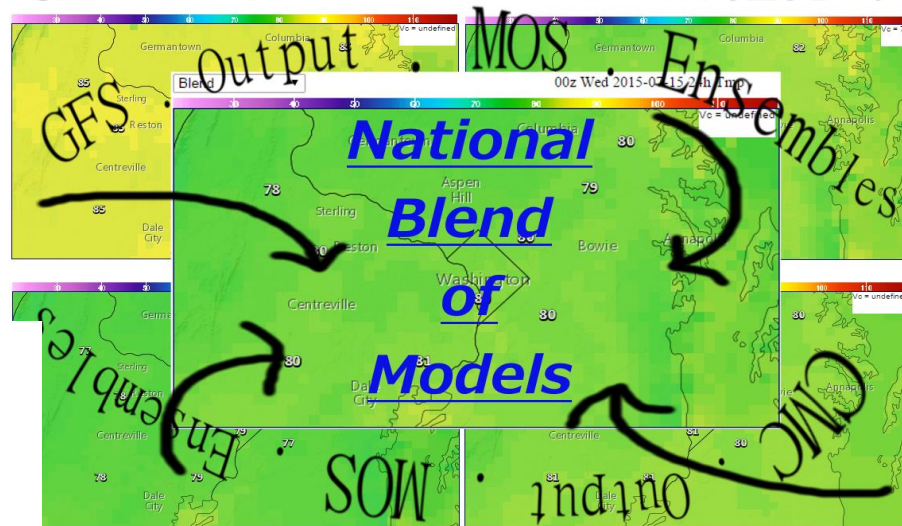

# Outline

- NBM Digital Aviation Services products
- **NWP components and expert weights**
- Techniques and verification
- Example products
- Potential future probabilistic capabilities

# Ceiling/Visibility/Lowest Cloud Base

NWP components and expert weights

- NBM Digital Aviation Services products
- NWP components and expert weights
- **Techniques and verification**
- Example products
- Potential future probabilistic capabilities

# Techniques and verification issues

- LLWS technique
- Wind speed and gust (URMA vs METAR issue) verification issues

# NBM Algorithm for Calculating Low Level Wind Shear (LLWS) Speed, Height, and Direction

1. Leverage the individual model inputs of the U and V components at: Surface, 500 ft (interpolated from Surface and 1000 ft), 1000 ft, 1500 ft (interpolated from Surface and 1000 ft), 2000 ft
2. Calculate the wind speed at each height and determine the wind speed differences between **all** possible layers: (a) [Surface-500 ft], (b) [Surface-1500 ft], (c) [Surface-2000 ft], (d) [500-1000 ft], (e) [500-1500 ft], (f) [500-2000 ft], (g) [1000-1500 ft], (h) [1000-2000 ft], (i) [1500-2000 ft]
3. The models for any particular layer whose wind speed differences are less than 30 knots are ignored in the calculations for (4), (5), and (6).

# NBM Algorithm for Calculating Low Level Wind Shear (LLWS) Speed, Height, and Direction

4. Normalize all wind speed shear values (for those models that indicate wind shear at any given level) so that the relative wind speed shear magnitudes between layers with different thicknesses can be compared.
5. Tabulate which model has the greatest wind speed shear for any given layer and assign the wind speed found at the **top** of that layer as the LLWS Speed. The LLWS height is simply assigned to the **top** of this layer.
6. Use that model's U- and V- component (at the **top** of that layer that exhibits the greatest LLWS in (5)) to calculate LLWS direction.

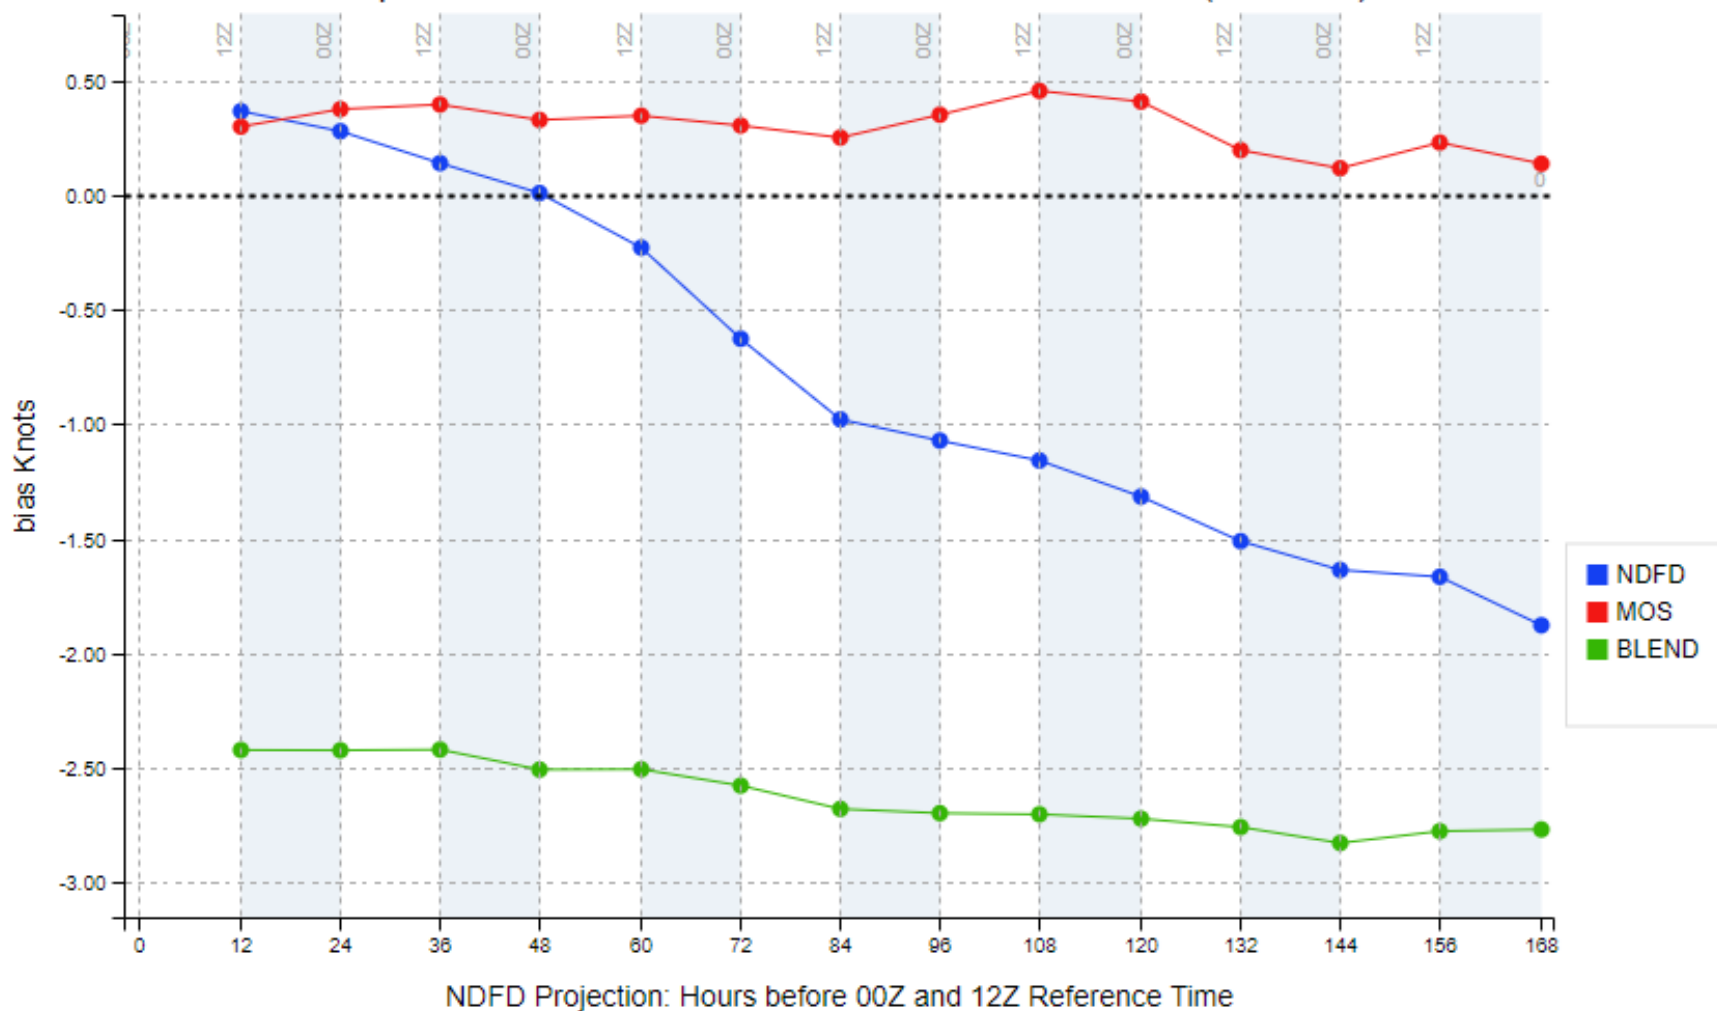

# Pronounced bias of NBM versus METARs

- NBM tuned to URMA, not METARs
- URMA has a wind speed low bias versus METARs, and so does NBM
- URMA has a wind gust high bias versus METARs, and so does NBM
- Therefore, the NBM gust factors tend to be higher than what you would normally expect (1.3 for marine, 1.5 to 2.0 for land). NBM are frequently 2.0 to 3.0+

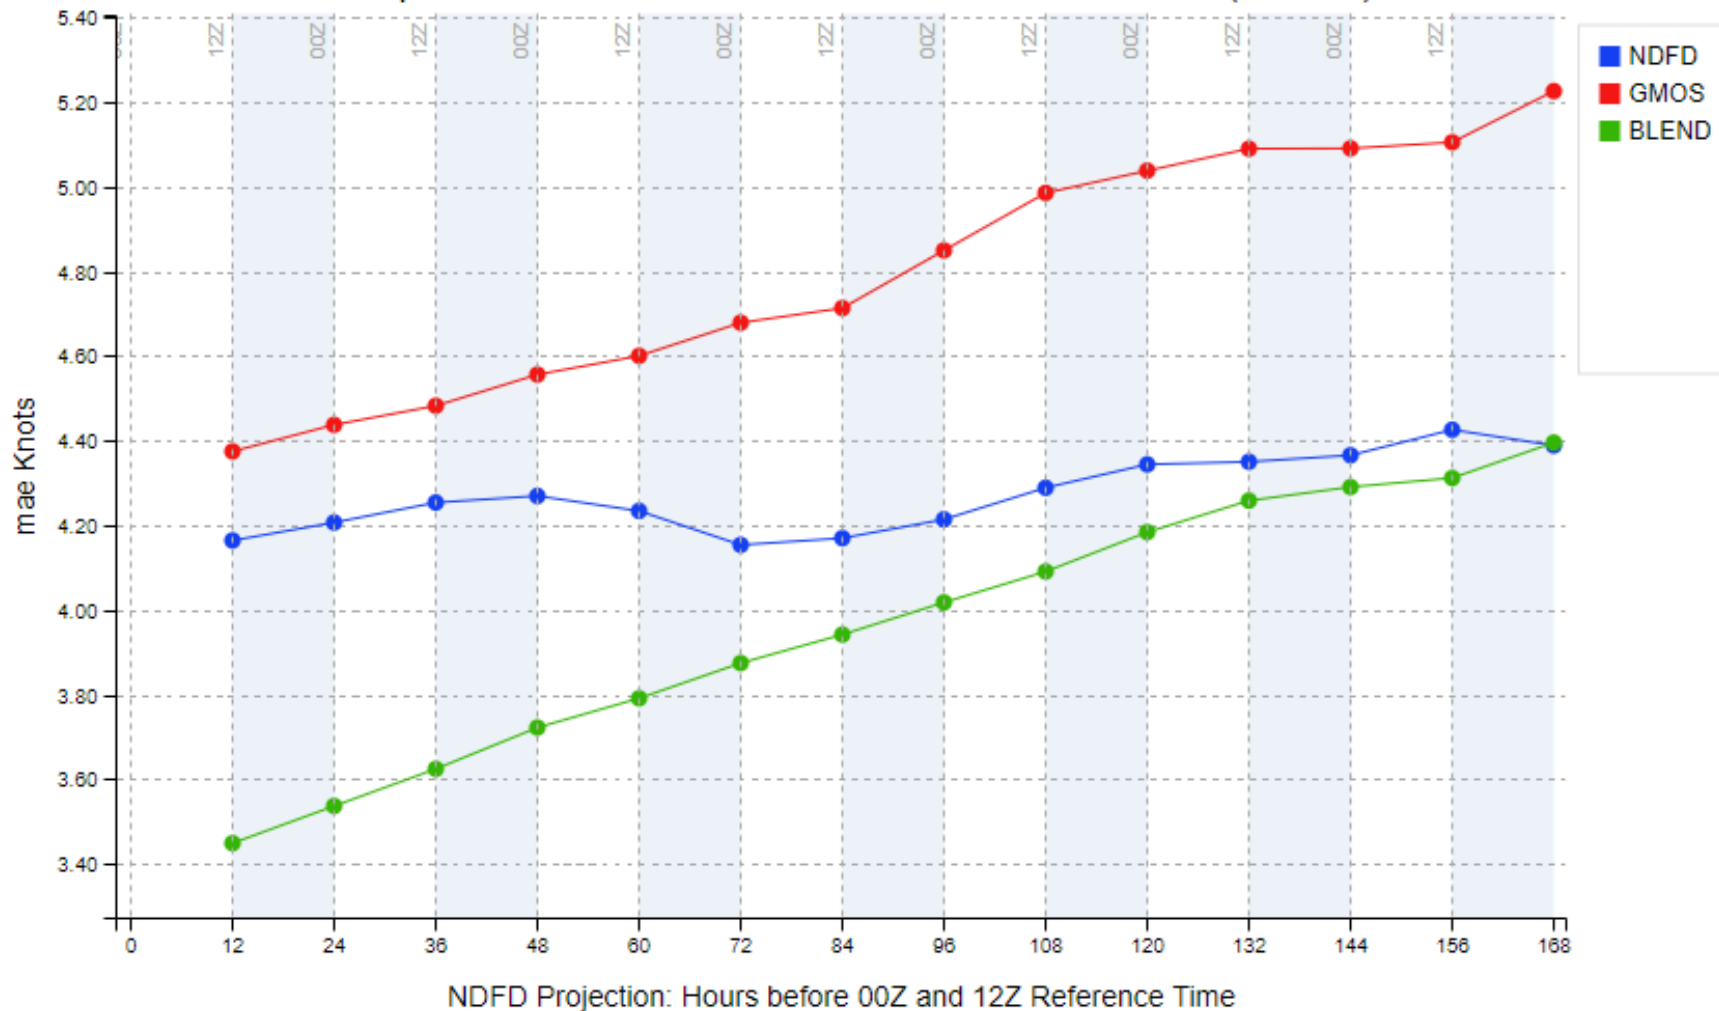

Wind Spd mae for: Western from 201810 to 201903 (METAR)

# Wind Spd bias for: Western from 201810 to 201903 (METAR)

Wind Spd mae for: Western from 201810 to 201903 (URMA)

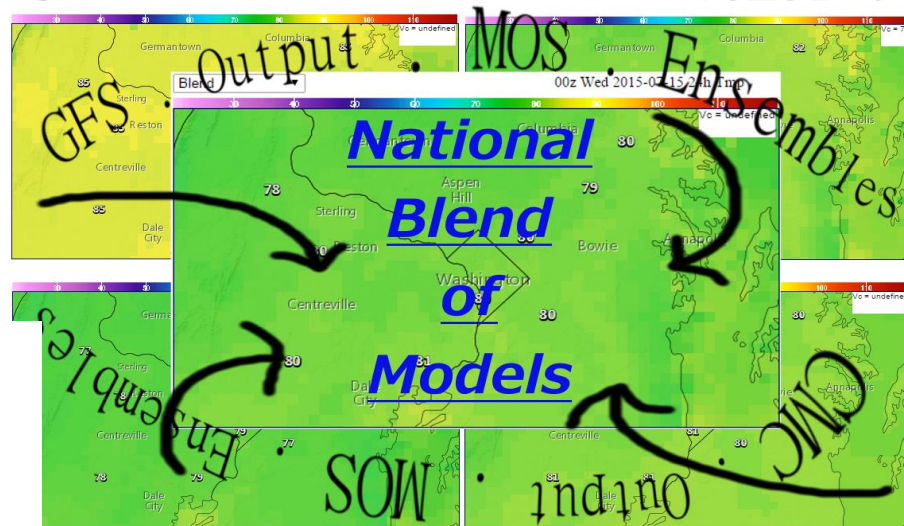

# Wind Spd bias for: Western from 201810 to 201903 (URMA)

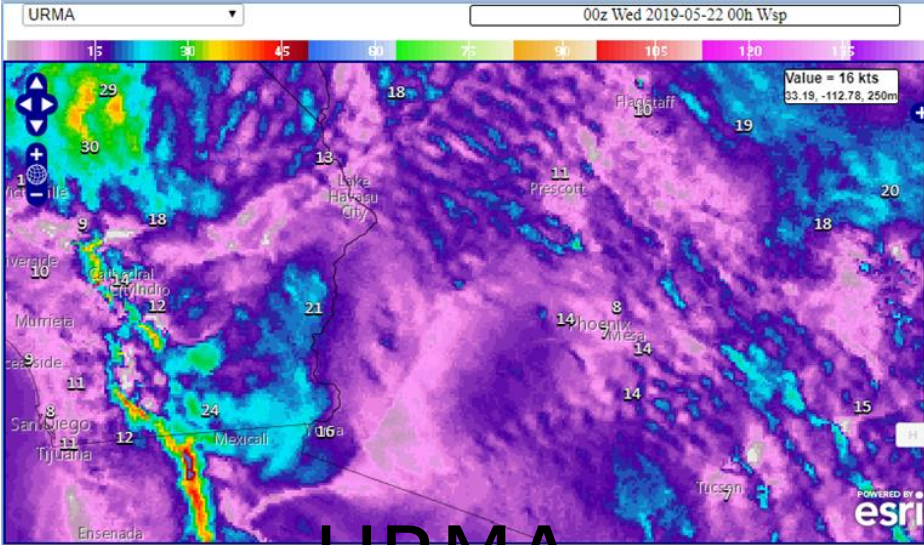

# Case study of METAR vs URMA in Phoenix area 00z May 22, 2019

METAR at KPHX 20 knots, URMA 7 knots

## The National Blend of Models (NBM)

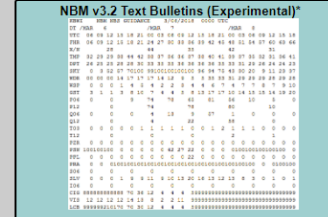

The National Blend of Models (NBM) is a nationally consistent and skillful suite of calibrated forecast guidance based on a blend of both NWS and non-NWS numerical weather prediction model data and post-processed model guidance. The goal of the NBM is to create a highly accurate, skillful and consistent starting point for the gridded forecast. This new way to produce NDFD grids will be helpful providing forecasters with a suite of information to use for their forecasts. The NBM is considered an important part of the efforts to evolve NWS capabilities to achieve a Weather-Ready Nation.

# Outline

- NBM Digital Aviation Services products
- NWP components and expert weights
- Techniques and verification
- Example products
- **Potential future probabilistic capabilities**

# Probabilistic Aviation Forecasts

- Probability of VLIFR, LIFR, IFR, MVFR:
  - Ceiling
  - Visibility
  - Combined
- Probability of exceedance for wind speeds and wind gusts
- Probability of runway usage based on wind speed and direction
- Probability of LLWS, Icing, turbulence
