Agricultural Best Management Practices and Mitigating Dust from Fallow Fields

Madeline Greenbaum
Air Compliance Officer

Luke Messer
Air Compliance Officer
Cropland Definition

“Cropland” means land on a commercial farm that: a. Is within the time-frame of final harvest to plant emergence, but does not include tillage activities; b. Has been tilled in a prior year and is suitable for crop production, but is currently fallow; or c. Is a turn-row. R18-2-610.16

Fallow Field Definition

“Fallow Field” means an area of land that is routinely cultivated, planted and harvested and is unplanted for one or more growing seasons or planting cycles, but is intended to be placed back in agricultural production. R18-2-610.20
Common Complaints and Solutions

- Weed abatement during high winds
  - In some cases: local authorities require weed abatement

- Lack of water as an option for dust mitigation
  - Increasing water restrictions

- Solution: Follow the Ag BMPs prior to fallowing the field
  - Create soil crust

Ag BMP General Permit for Pinal Cropland

CATEGOR I: Tillage
Super Tillage BMP:
Selecting Reduced Tillage System or Conservation Tillage will eliminate the requirement of selecting BMPs in Category II (Ground Operations and Harvest) and Category V (Cropland)
☐ Reduced Tillage System
☐ Conservation Tillage

Otherwise select at least one of the following:
☐ Combining Tractor Operations
☐ Equipment Modification
☐ Multi-year Crop
☐ Cessation of night tillage
☐ Planting Based on Soil Moisture
☐ Precision Farming
☐ Tillage Based on Soil Moisture
☐ Timing of Tillage Operation
☐ Transgenic Crops
☐ Transplanting

High Risk Dust Generation Days BMP:
On the day before and during the day that is forecast to be high risk for dust generation by the Pinal County Dust Control Forecast a farmer must ensure that one the above underlined BMPs in category I is selected and is being implemented. If not implementing one of the underlined BMPs then the BMP below must be selected and implemented on a Pinal County high risk dust generation forecast:
☐ Limited Tillage Activity*

*Implemented only on the day forecast to be high risk for dust generation.

• **Equipment modification**: ...modifying and maintaining an existing piece of agricultural equipment, installing shielding equipment, modifying land planting and land leveling, matching the equipment to row spacing, or grafting to new varieties or technological improvements.

• **Cessation of Night Tilling**: the discontinuation of tillage from sunset to sunrise on a day identified by the Pinal County Dust Control Forecast as being high risk of dust generation.

• **Precision Farming**: reducing the number of passes across a commercial farm by at least 12 inches per pass by using GPS to precisely guide farm equipment in the field.

• **Tillage based on soil moisture**: reducing PM emissions by irrigating fields to the depth of the proposed cut prior to soil disturbances or conducting tillage to coincide with precipitation.

• **Limited tillage activity**: ceasing tillage operations on a day identified by the Pinal County Dust Control Forecast to be high risk for dust generation.
Ag BMP General Permit for Pinal Cropland

**CATEGORY III: Non-cropland**

Select at least one of the following:

- **Access Restriction**
- **Aggregate Cover**
- **Wind Barrier**
- **Critical Area Planting**
- **Organic Material Cover**
- **Reduce Vehicle Speed**
- **Synthetic Particulate Suppressant**
- **Watering**

**High Risk Dust Generation Days BMP:**

On the day before and on during the day that is forecast to be high risk for dust generation by the Pinal County Dust Control Forecast a farmer must ensure that one of the above underlined BMP’s is being implemented. If not implementing one of the underlined BMPs, then the BMP below must be selected and implemented on a Pinal County high risk dust generation forecast:

- **Watering on a High Risk Day**

*Implemented only on the day forecast to be high risk for dust generation.

- **Access restriction:** reducing PM emissions by reducing the number of trips driven on agricultural aprons and access roads by restricting or eliminating public access to noncropland or commercial farm roads with signs or physical obstruction at locations that effectively control access to the area.

- **Wind barrier:** reducing PM emissions and wind erosion by constructing a fence or structure, or providing a woody vegetative barrier by planting a row of trees or shrubs, perpendicular or across the prevailing wind direction to reduce wind speed by changing the pattern of air flow over the land surface.

- **Critical area planting:** reducing PM10 emissions and wind erosion by planting trees, shrubs, vines, grasses, or other vegetative cover on noncropland in order to maintain at least 60 percent ground cover.

- **Organic material cover:** reducing PM emissions and wind erosion and preserving soil moisture by applying and maintaining cover material such as animal waste or plant residue, to a soil surface to reduce soil movement.

- **Synthetic particulate suppressant:** reducing PM emissions and wind erosion by providing a stabilized soil surface on noncropland or commercial farm roads with a manufactured product.

- **Watering:** reducing PM emissions and wind erosion by applying water to noncropland or commercial farm road bare soil surfaces during periods of high traffic until the surfaces are visibly moist.
Ag BMP General Permit for Pinal Cropland

CATEGORY V: Cropland

Select at least one of the following:

- Wind Barrier
- Cover Crop
- Cross-wind Ridges
- Chips/mulches
- Sequential Cropping
- Residue Management
- Surface Roughening

And select at least one of the following:

- Multi-year Crop
- Permanent Cover
- Stabilization of soil prior to plant emergence

- **Cover crop**: establishing cover crops that maintain a minimum of 60 percent ground cover. Native or volunteer vegetation that meets the minimum ground cover requirement is acceptable.

- **Cross-wind ridges**: stabilizing soil and reducing PM emissions and wind erosion by creating soil ridges in a commercial farm by tillage or planting operations. Ridges should be...aligned as perpendicular as possible to the prevailing wind direction.

- **Chips/mulches**: reducing PM emissions and soil movement and preserving soil moisture by applying and maintaining nontoxic chemical or organic dust suppressants to a depth sufficient to reduce PM emissions.

- **Residue management**: reducing PM emissions and wind erosion by maintaining a minimum of 60 percent ground cover of crop and other plant residues on a soil surface between the time of harvest of one crop and the commencement of tillage for a new crop.

- **Surface roughening**: reducing PM emissions or wind erosion by manipulating a soil surface by means such as rough discing or tillage in order to produce or maintain clods on the land surface.

High Dust Risk Forecast

Dust Risk-Based Forecast | Pinal County

Updated On: 03/03/2022 - 9:19 AM

Friday

**Stagnation:** Light morning stagnation

**Wind:** Southwesterly winds of 15-30 mph with higher gusts

Saturday

**Stagnation:** Light morning stagnation

**Wind:** Southwesterly winds of 15-25 mph with higher gusts

Sunday

**Stagnation:** Light morning stagnation and evening stagnation

**Wind:** Westerly winds of 5-15 mph

Conclusion

- Be mindful that farming practices are dusty but can be managed.

- In conclusion, if you are unsure about an agricultural activity, contact us and we will check it out.
