What we know:
• Temperatures are trending colder
• Storm is trending slower – Saturday may remain dry (20-30% chance); bulk of precipitation is favored Sunday (60% chance), drying out Monday.
• A wintry mix of rain/sleet/freezing rain/snow is possible during this time frame.

What we don’t know:
• Exact timing and track of storm system, which impacts areal coverage and type of precipitation, as well as amounts.

The system remains out over the Pacific Ocean! Once it moves over land early Thursday, upper air balloons will be able to supplement satellite data on the system, which will help the models come into better agreement.
