December 23-26, 2022 Arctic Blast

National Weather Service Charleston, WV

1028

IR Satellite Imagery w/ Surface Analysis Overlay 7 AM – Saturday, December 24

Event Synopsis

An arctic front located across the central Midwest on the morning of Thursday, December 22nd would quickly shift eastward towards the region throughout the day. By late evening, the front was rapidly approaching northeast Kentucky and southeast Ohio. Temperatures in advance of the front were warm enough for rain showers, but precipitation would quickly switch to snow as the arctic front rapidly pushed through the region, crossing the entire NWS Charleston forecast area from approximately 12 AM to 5 AM on Friday, December 23rd.

While post-frontal snowfall was on the light side with generally less than two inches across most locations, the impacts would be much more significant, as sustained winds and gusts quickly increased following the front's passage courtesy of cold air advection and an extremely tight pressure gradient. Wind gusts of 40-50+ mph were recorded during the morning of December 23rd as temperatures rapidly plummeted across the region, resulting in some blowing and drifting snow. Temperature drops in excess of 40 degrees over the course of six hours were recorded across portions of the region, leading to a flash freeze of roadways in some cases. Huntington, WV went from 45 °F at 1:20 AM to (+) 1 °F at 7:20 AM, or a temperature drop of 44 degrees in 6 hours!

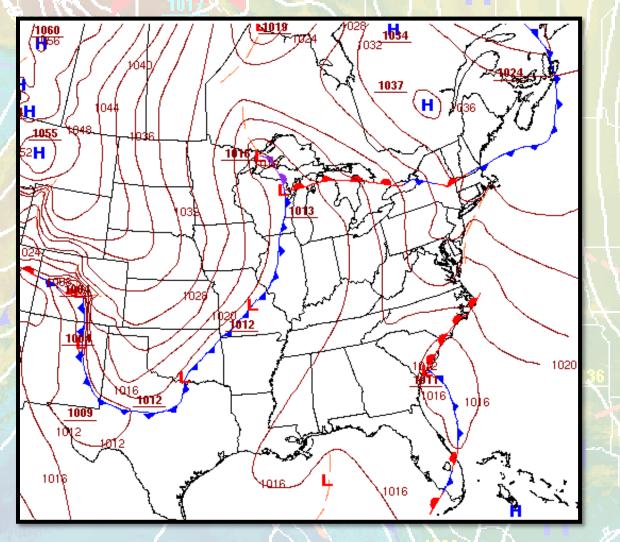

These bitter temperatures and gusty winds resulted in dangerous wind chills across the entire region on December 23rd into the morning of December 24th. Wind chills of 10 to 30 below occurred in the lowlands, with values as low as 50 below across the higher mountain elevations! Accumulating snowfall would quickly end for most lowland locations by late morning of December 23rd, with just some very light additional accumulations for the higher terrain through Christmas morning.

Event Synopsis (Continued)

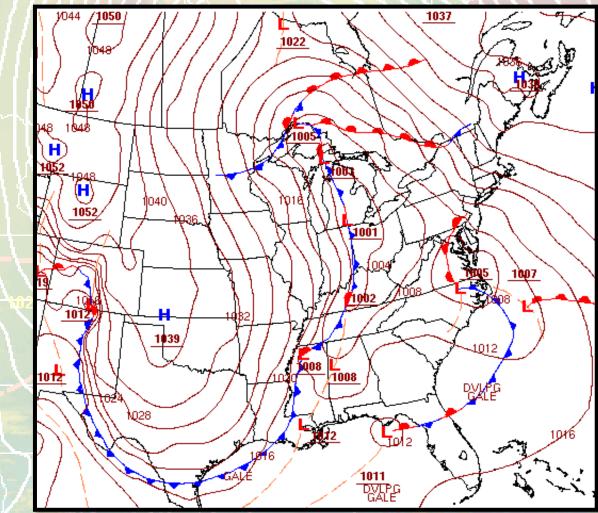

The bitterly cold temperatures would however persist into the holiday weekend. Low pressure associated with the (aforementioned) arctic front would phase with a disturbance moving up the eastern seaboard during the morning of December 23rd. This helped to facilitate a rapid intensification of the system, with a central pressure of approximately 996 mb just north of Detroit, Michigan at 11 PM December 22nd lowering to 968 mb at 11 PM December 23rd over the southwest portion of Quebec. Given such, the system officially met the criteria of a "**Bomb Cyclone**", in which barometric pressure readings dropped in excess of 24 mb (0.71 in Hg) over a 24-hour period.

The immense size, slow movement, and extremely tight pressure gradient of the system would allow for continued gusty conditions and bitter cold temperatures (and wind chills) through Christmas Eve, albeit not as harsh as what was observed on December 23rd. The system would continue to gradual weaken and exit northeast away from the area on Christmas Day, allowing for winds to continue to gradually lessen. Well below normal temperatures would persist through December 25-26th, but to a much lesser extent than what was observed the prior two days. Strengthening return flow as high pressure shifted east across the region on December 27th would allow the area to finally exit the deep freeze.

WINDY

- AM on Christmas Eve at Snowshoe, WV.
- What makes this cold spell even more impressive is the <u>significant</u> lack of snow cover upstream from the region preceding the arrival of the arctic front and bitterly cold air. Generally, such a scenario would help to modify a cold air mass as it moved eastward. This however wasn't really the case with this system, as the immense size/strength of it was able to rapidly advect the bitterly cold temperatures eastward as it continued to deepen, despite the lack of snow cover. Imagine what temperatures could have been if there was a broad and significant antecedent snowpack upstream of the area..

Temperature Drop at Charleston Yeager Airport on Friday, December 23rd

Highest Wind Gust Reports

Wind gusts of 40-50+ mph were reported on Friday, December 23rd following the passage of the arctic front. While the graphic to the right highlights the highest wind gust reports, it is also important to note the temporal length of breezy/gusty conditions with this system. While not as strong as on December 23rd, breezy to gusty conditions did linger across the region all the way into Christmas morning. All told, the winds associated with this system lead to blowing and drifting snowfall, dangerous to life threatening wind chills, and some downed trees and power outages.

Lowest Observed Wind Chills

To the right is a summary of lowest observed wind chills from Friday, December 23rd, through Saturday morning, December 24th. This time period covers the peak of the cold outbreak.

Wind chills on December 23-24 were cold enough that a Wind Chill Warning was issued for the entire NWS Charleston, WV forecast area during the peak of the cold outbreak. The lowest observed reading was a bitterly cold -51 °F at Snowshoe, WV on the morning of December 24th (1:15 AM).

Elkins Recent Low Wind Chill: -28 Record: -39 ON 1/20/1985

Snowfall Totals

Event total snowfall was on the light side across the region. Amounts were generally 2" or less for the lowlands, with up to a few inches more across the higher terrain. Despite the low amounts, flash freezing conditions and/or blowing/drifting snowfall made the impacts more significant. Additionally, the very cold temperatures made salt ineffective on roadways. Attached (right) are two tables highlighting event snowfall totals across the region of at least 1".

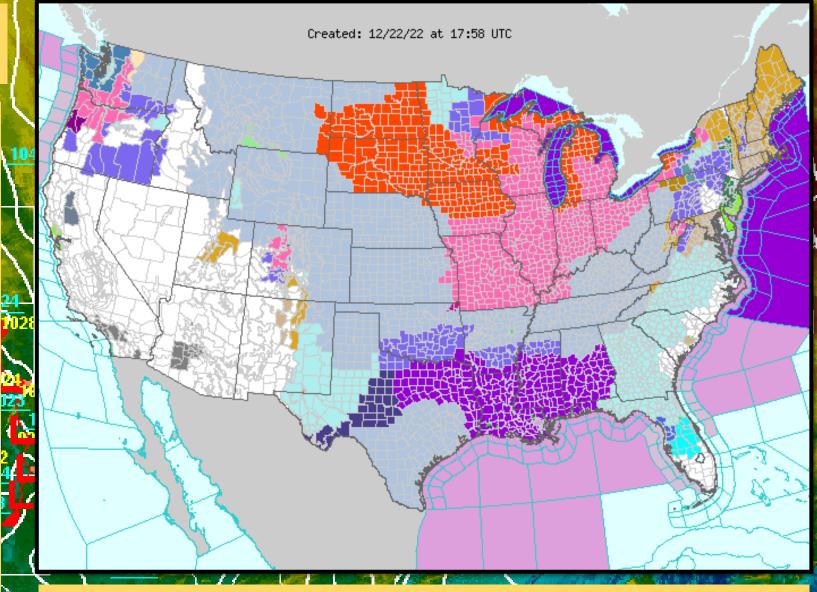

*Please note that the table furthest right is a continuation of observations from West Virginia counties.

Final Thoughts

1017

The December 23-26, 2022 Arctic Blast brought multiple hazards to the region. Gusty winds combined with very cold temperatures to produce dangerous to life threatening wind chills. Additionally, rapidly dropping temperatures lead to some roadways flash freezing. There were even some power outages that occurred during the bitter cold due to the gusty conditions. And while conditions were bad locally, much of the rest of the country felt the effects of this system as well, as can be seen right. This truly was a widespread, high impact cold wave, that won't soon be forgotten.

National Weather Service Watch, Warning, Advisory Display at 1 PM December 23rd. This image illustrates how extensive the cold/impacts were from this system, with much of the country being affected.
