

National Weather Service Tallahassee, Florida

Severe to Extreme Drought Across The Region

Current Drought

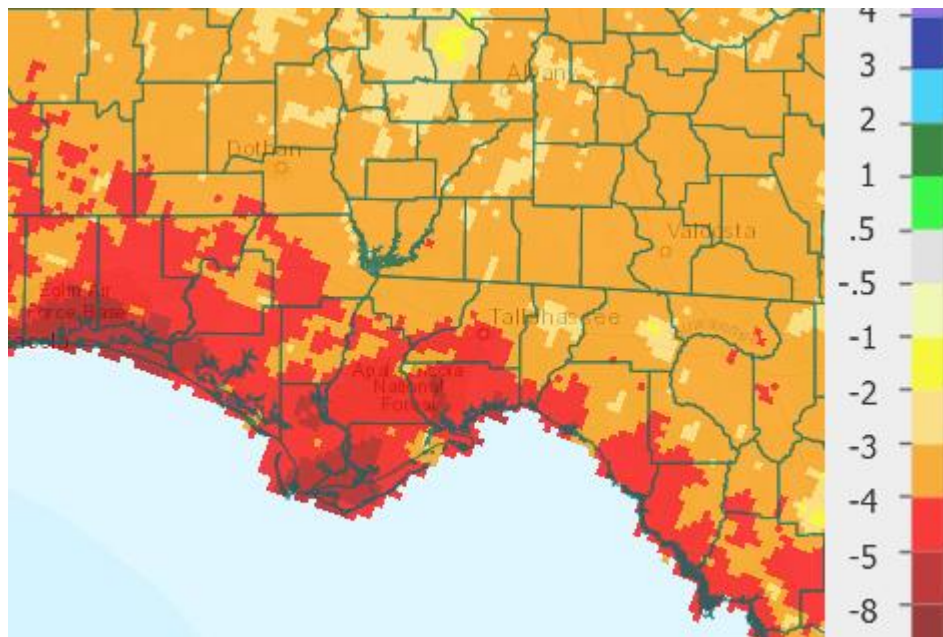

September 2019 was extremely dry across the region, and with already dry conditions in place, drought conditions rapidly worsened. Large areas of the region are included in severe drought, with an area of extreme drought across portions of Southeast Alabama and into the Florida Panhandle. With little rain forecast over the next couple of weeks, drought conditions are expected to worsen through October.

More Info:

Rainfall has been much below normal over the last 30 days, as shown at right. There are some locations that have seen no measurable rainfall in more than 40 days.

With drought conditions worsening, a drought information statement is now being issued, which provides in depth information on impacts across the region. You can view that statement [at this link](#).
