

Drought Information Statement for West Central and Southwest Florida

Valid June 19, 2026

Issued By: National Weather Service Tampa Bay, FL

Contact Information: sr-tbw.webmaster@noaa.gov

- This product will be updated June 26, 2026 or sooner if drought conditions change significantly.
- Please see all currently available products at <https://drought.gov/drought-information-statements>.
- Please visit <https://www.weather.gov/tbw/DroughtInformationStatement> for previous statements.
- Please visit <https://www.drought.gov/drought-status-updates> for regional drought status updates.

- Drought improved in some parts of the region, but the overall Moderate to Extreme drought conditions persists across West Central and Southwest Florida.
- Drought characteristics remain largely long-term with low river levels, dry soils, and elevated fire danger remaining despite some recent rain.

U.S. Drought Monitor

Link to the [latest U.S. Drought Monitor](#) for West Central and Southwest Florida

- The extended duration of limited rainfall has continued the need for D1 (Moderate Drought) to D3 (Extreme Drought) across West Central and Southwest Florida.
- Drought intensity and Extent
 - **D3 (Extreme Drought)**: Northern Levy, SW Hernando, W Pasco, Pinellas, NW and S Hillsborough, SW Polk, W & N Manatee, W Sarasota, Cent Hardee, Cent and E Desoto, an NW Charlotte.
 - **D2 (Severe Drought)**: Rest of Levy, Citrus, Sumter, Rest of Hernando, Cent and E Pasco, NE Hillsborough, Polk, S Manatee, E Sarasota, Highlands, Cent Charlotte, and W Lee County.
 - **D1 (Moderate Drought)**: NE Polk County, inland Charlotte, and inland Lee County.

Recent Change in Drought Intensity

Link to the latest [1-week change map](#) for West Central and Southwest Florida

- There have been some improvements in the long-term deficits across parts of the region.
- However, the pace of water consumption by vegetation is higher this time of year, meaning that the rain that is falling is quickly being used up.
- As rain begins to fall more regularly, this should allow the system to begin recovering, and this will favor gradual improvement of drought conditions over time.
- **One Week Drought Monitor Class Change**
 - **Drought Improved:** Parts of central and southwest Florida.
 - **No Change:** Rest of West Central and Southwest Florida.

Data Valid: 06/16/26

Precipitation

Last 30 Days

- While there has been some rainfall over the last 30 days, there has been a fairly dry period once again over the last couple of weeks that has led to generally below normal rainfall across the region south of I-4.
- When factoring in long term deficits, there continue to be greater impacts.

Temperature

7-Day and 30-Day Temperature Anomalies

- Temperatures are now consistently warm.
- Vegetation uses more water.
- With depleted groundwater supplies, this means that rainfall is quickly being used.
- Above normal temperatures are expected over the next few weeks, contributing to greater evaporation of water as well.

Summary of Impacts

Links: See/submit [Condition Monitoring Observer Reports \(CMOR\)](#) and view the [Drought Impacts Reporter](#)

Hydrologic Impacts

- The Southwest Florida Water Management District provided a [River System Update](#) on **June 1, 2026** for the Withlacoochee River.
- Streamflows remain exceptionally low in many spots for this time of year. In some areas, there is still no water flow at all. This is leading to algae blooms along portions of some area rivers. To report an algae bloom, go to [ReportAlgalBloom.com](#) or call the hotline at 1-855-305-3903.
- In the Green Swamp, there is essentially no water movement. All the cypress swamps and wet prairies that seasonally flow to the Withlacoochee River need additional rainfall before flows will resume to rivers.
- Some improvement is beginning to occur, but is again being slowed by drier weather this past week.

Summary of Impacts

Links: See/submit [Condition Monitoring Observer Reports \(CMOR\)](#) and view the [Drought Impacts Reporter](#)

Hydrologic Impacts

- Areawide, surface/groundwater levels remain low, accentuating the long term nature of this drought.
- Many ponds and lakes dried up across the region.
- While not necessarily seeing further drastic decline, rainfall has not been enough yet to really replenish what has been lost.

(Image: NWS and FDEP)

Summary of Impacts

Links: See/submit [Condition Monitoring Observer Reports \(CMOR\)](#) and view the [Drought Impacts Reporter](#)

Agricultural Impacts

- Hernando, Polk, Hardee, and Sarasota County farmers have noted that the dryness was the worst seen in at least 15 to 20 years. Some improvement has been noted.
- Some crop plantings were delayed by farmers.
- Many plants less drought-resistant are beginning to recover from drought-induced stress as summer rains begin to occur.
- Cisterns had to be used in some areas to supplement the normal potable water supply.
- Some ponds had to be dug deeper to keep a water supply available for livestock.
- Supplemental feeding with hay and other feed has been required to sustain livestock. [Report impacts here.](#)

Fire Hazard Impacts

- The [Keetch-Byram Drought Index \(KBDI\)](#) still remains as high as 615, indicating that soils remain rather dry in areas with these high values. However, soils are beginning to moisten in some locations, with Nature Coast counties seeing the lowest KBDI values.
- Brush fires continue to occur, with a few large, highly visible fires and numerous other fires across the Florida peninsula. Some wildfires have caused damage to structures, temporary road closures, and have grown to thousands of acres before containment.

Summary of Impacts

Mitigation Actions - Southwest Florida Water Management District

- Southwest Florida Water Management District has declared a [Modified Phase III “Extreme” Water Shortage](#) that began on April 3, 2026. Always refer to [city or county](#) regulations first.
- An emergency order was issued to Tampa Bay Water to lower the Middle Pool of the Tampa Bypass Canal from 12 feet to 10 feet to continue augmenting the City of Tampa’s Hillsborough River Reservoir. The order expires July 1, 2026.
- An emergency order was issued to the City of Punta Gorda to temporarily withdraw up to an additional 2.2 million gallons per day from Shell Creek to provide to the Peace River Manasota Regional Water Supply Authority. The order expires July 1, 2026.

Summary of Impacts

Links: See/submit [Condition Monitoring Observer Reports \(CMOR\)](#) and view the [Drought Impacts Reporter](#)

Mitigation Actions - Other Partners

- Tampa Bay Water has issued a [Stage 3 Extreme Regional Water Supply Shortage](#)
- A [State of Emergency](#) has been issued for the area due to the impacts of Winter Weather, Drought, and the increased Wildfire Risks.
- A modified Phase II Water Shortage is in effect for a portion of [Northeast Cape Coral](#) in Lee County.
- [Burn Bans](#) remain in effect for some counties in West Central and Southwest Florida. Please contact the county for specifics.

A Perspective on this Drought

Link to [Drought Monitor Time Series](#)

How does this drought compare to past long term droughts in the NWS Tampa Bay forecast area?

- There have been four long duration droughts since 2000 in West Central and Southwest Florida, including the current drought.
- While conditions are significant, they have not reached the intensity and duration experienced in the 2000/2001 drought.
- This is the most impactful drought within the NWS Tampa Bay area since 2012.
- This was the first time since the drought monitor began in 2000 that the **entire** State of Florida was D1 (Moderate drought) or worse.

State of Florida Time Series of D1, D2, D3, and D4 drought by percentage (bottom). Records go back to 2000.

- D1 (Moderate Drought)
- D2 (Severe Drought)
- D3 (Extreme Drought)
- D4 (Exceptional Drought)

Hydrologic Conditions and Impacts

USGS Streamflow Map for Florida

- With a lack of rainfall over the last couple of weeks, streamflows have dropped below normal across many parts of the region.
- Streamflows should hold fairly steady, if not begin to further recover as rainfall becomes more consistent over the next few weeks.

Agricultural Impacts

2025 Florida Crop Report

With some wetter weather over the last month, soil moisture has increased slightly. However, water is being absorbed by vegetation, filtering into groundwater storage, and evaporating due to the warm weather.

Fire Hazard Impacts

Link to [Wildfire Potential Outlooks from the National Interagency Coordination Center](#).

- The Keetch-Byram Drought Index (KBDI) remains high across parts of the region where the rain has not been significant; however, the Nature Coast and parts of southwest Florida have seen some improvement
- The KBDI will rise quickly outside this region when it does not rain for a few days, with antecedent conditions favoring the rapid absorption and consumption of the water that falls.
- Brush fires have continued to occur with [Burn Bans](#) in effect for some counties.
- The Significant Wildland Fire Potential Outlook for June and July supports only normal fire activity as the rainy season ramps up.

Keetch-Byram Drought Index | Thu 06/18/26, 02:00 PM EDT

Precipitation Outlook

7-Day and 8-14 Day Precipitation Outlooks

- Some rainfall is expected over the region over the next week, but overall amounts look to be below normal in most locations.
- A continued drier than normal period is expected in a week or so as high pressure sets up over the region.
- A consistent period of regular, near daily rainfall is needed to substantially alleviate the drought conditions.

Long-Range Outlooks

The latest monthly and seasonal outlooks can be found on the [CPC homepage](#)

- The outlook for July suggests equal chances of above, below, and near normal rainfall, with a 50-60% chance of above normal temperatures.
- With the return of more typical daily storms, the large rainfall deficits should gradually be eroded, alleviating some of the drought concerns.

Monthly Precipitation Outlook for July 1, 2026–July 31, 2026

When Does the Rainy Season Usually Ramp Up?

When Could There Be Some Drought Relief?

- The most consistent and widespread rainfall historically kicks in during mid-June.
- However, there are often some days/weeks in late May or early June where greater thunderstorm coverage does occur; this year looks was no different.
- More details about our Rainy Season can be found [here](#).

Drought Outlook

The latest monthly and seasonal outlooks can be found on the [CPC homepage](#)

- Given the prediction for near normal rainfall in the months ahead, drought is expected to improve across the region over the next three months - if not end altogether.
- Should rainfall over the next three months be below normal, drought improvement may be delayed or persist, especially now that temperatures are consistently warm.
- We have likely now seen the worst of the drought conditions, at least until the dry season returns - even if drought does not completely subside.
