June 2020 Climate Summary for West Central and Southwest Florida

The first week or so of June 2020 was cooler and wetter than normal thanks to deep tropical moisture on the east side of Tropical Storm Cristobal causing abundant clouds and numerous showers and thunderstorms. Then during the middle of the month an upper level trough meandered over the southeast U.S. setting up a southwest to west flow. This flow persisted late in the month as deep layered high pressure became established over Florida leading to mainly dry and hot conditions. For the month average temperatures across West Central and Southwest Florida ranged from slightly below normal to about 3 degrees above normal which placed a few locations in the Top Ten Warmest for June.

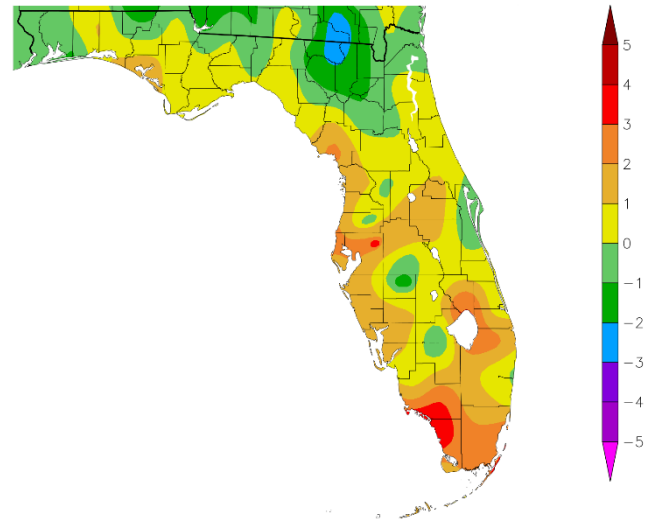

JUNE TEMPERATURE RANKINGS (Warmest-°F):

Location	June 2020 Rank	June 2020 Avg Temp	Normal Jun Temp	Dep fm Normal	Record/Prev Rec Warmest	Records Began

6/1/2020 - 6/30/2020

Departure from Normal Temperature (F)
6/1/2020 - 6/30/2020

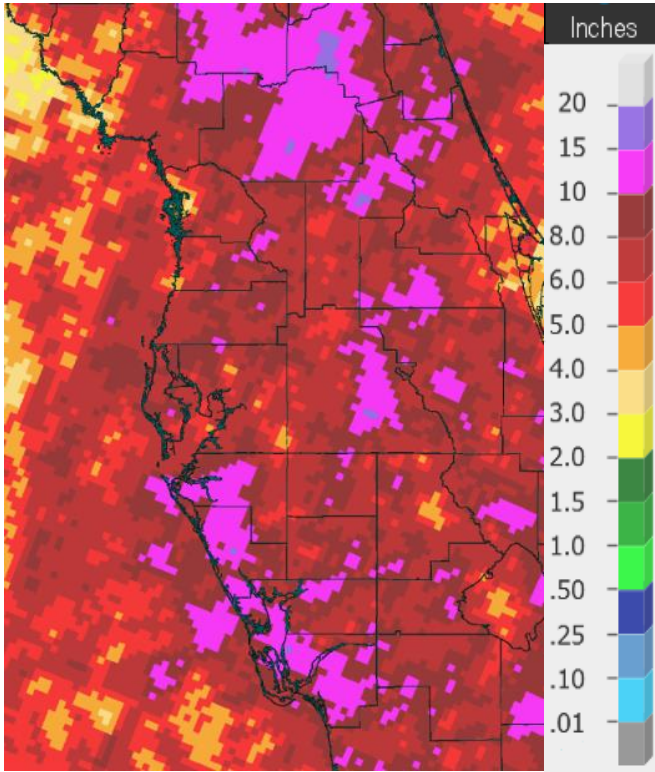

Graphics Source: NOAA Regional Climate Centers

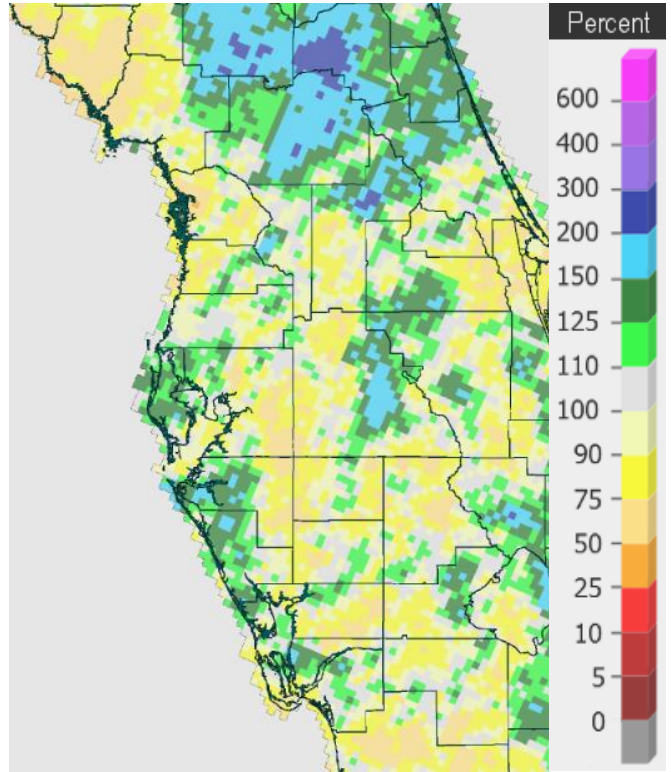

As previously mentioned, rainfall during the first week or so of the month was well above normal in many areas as deep tropical moisture spread well east of Tropical Storm Cristobal. Some areas near the coast from Bradenton south to Fort Myers received close to what is normal for the entire month of June in only a few days. Then during the second half of the month we saw many days with southwest to west flow taking most of the thunderstorms into the interior and eastern half of the Florida peninsula while the west coast counties saw little if any rain. For the month we had a wide range in rainfall with some spots less than 75 percent of normal while others were over 150 percent of normal.
