February 2018 and Winter 2017-18 Climate Data

As is typical during a La Niña winter we saw a wide range of temperatures with several days where morning lows were below freezing, but overall for the Winter (December/January/February) temperatures averaged slightly above normal. The big story however was the warm temperatures this February with most locations ending up as the Warmest February since records began, some over 100 years ago, as seen in the table below.

The following graphics depict the monthly departure from average temperature (based on the 1981-2010 Normals) across the region. For December we see that temperatures were about 2-4 degrees above normal, followed by 1-4 degrees below normal in January. As for February the temperatures soared and were 7-11 degrees above normal.

Departure from Normal Temperature (°F)

Thanks to the very warm February the average temperature for the Winter (December/January/February) was about 1 to over 4 degrees above normal and helped place a few locations in the Top Ten Warmest as seen in the following table.

Winter 2017-2018 Temperature Departure from Normal (°F)

As for rainfall most of the region was below normal this winter which is also pretty typical for a La Niña winter since the storm track tends to be further north. If not for two heavy rainfall events, one at the end of January and another near the beginning of February, rainfall would have been much lower from around the Tampa Bay area northward into the Nature Coast, closer to what was seen across the rest of the Florida peninsula where some areas received less than 50 percent of normal rainfall.

Percent of Normal Rainfall

On the following pages are tables of the Top Ten Warmest, Coolest, Wettest, and Driest Februarys and Winters (December/January/February) at some official NWS locations, and the 1981-2010 Normal (average) temperature and rainfall.
