Space Weather Safety

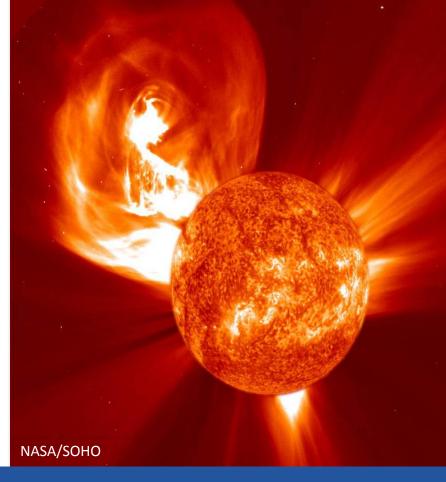

Know Your Risk Take Action Be a Force of Nature

Understanding Space Weather

- The sun is the main source of space weather.
- Bursts of plasma called coronal mass ejections (CMEs) can be directed towards the Earth.
- CMEs can produce large geomagnetic storms, potentially causing disruptions and anomalies to satellites, power grids, and air traffic communications.
- An important thing to remember; Earth's magnetosphere, ionosphere, and atmosphere do a great job of protecting us from the most hazardous effects.
- Storms large enough to cause the disruptions listed above are very rare.

Impacts are Potential Loss of:

- Water and wastewater distribution systems
- Perishable foods and medications
- Heating/air conditioning and electrical lighting systems
- Computer systems, telephone systems, and communications systems
- Public transportation systems
- Fuel distribution systems and fuel pipelines
- All electrical systems that do not have back-up power

Preparation for an Extreme Space Weather Storm

- Ensure adequate water supply is available.
- Maintain proper medication supply.
- Keep gas tank at least half full.
- Keep extra batteries for phone (or have solar power/hand crank charger).
- Maintain at least one non-cordless phone.
- Prepare family contact sheet. Have a plan.
- Keep important documents in non-powered safe/lock box.
- Have key to house

During an Extreme Space Weather Storm

- Follow the <u>Emergency Alert System (EAS)</u> instructions.
- Follow energy conservation measures.
- Restrict telephone usage to emergency situations only.
- Avoid using elevators.
- Review evacuation plans, supply lists (including medication), and family contact list.
- Avoid unnecessary travel. Power outages can affect public transportation as well as traffic signals.

Following an Extreme Space Weather Storm

- Listen to Local Officials.
- Follow any emergency plans established by <u>state and local government</u>.
- Monitor emergency broadcast radios for EAS updates.
- Inventory supplies, medications, water levels, etc.
- Follow evacuation orders.
- Replenish (if needed) to prepare for future use.
- Maintain energy conservation efforts until power can be restored.

Amazing Side Effect: The Aurora!

- Aurora Borealis, or Northern Lights, are more perceptible in the winter months in the northern hemisphere, due to longer periods of darkness.
- They are a result of collisions between atmospheric gases and precipitating charged particles.
- Each gas (oxygen, nitrogen molecules, and atoms)
 emits a particular color depending on the energy of
 the precipitating particles.
- The patterns and forms of the aurora include quiescent arcs, rapidly moving rays, curtains, patches, and veils.
- Check the <u>Aurora 30 minute forecast</u> to see if viewing is favorable in your area
