# The National Blend of Models v4.1 for Aviation

Adam Schnapp

NOAA/NWS/OSTI/MDL Silver Spring, MD

Southwest Aviation Weather Safety Workshop

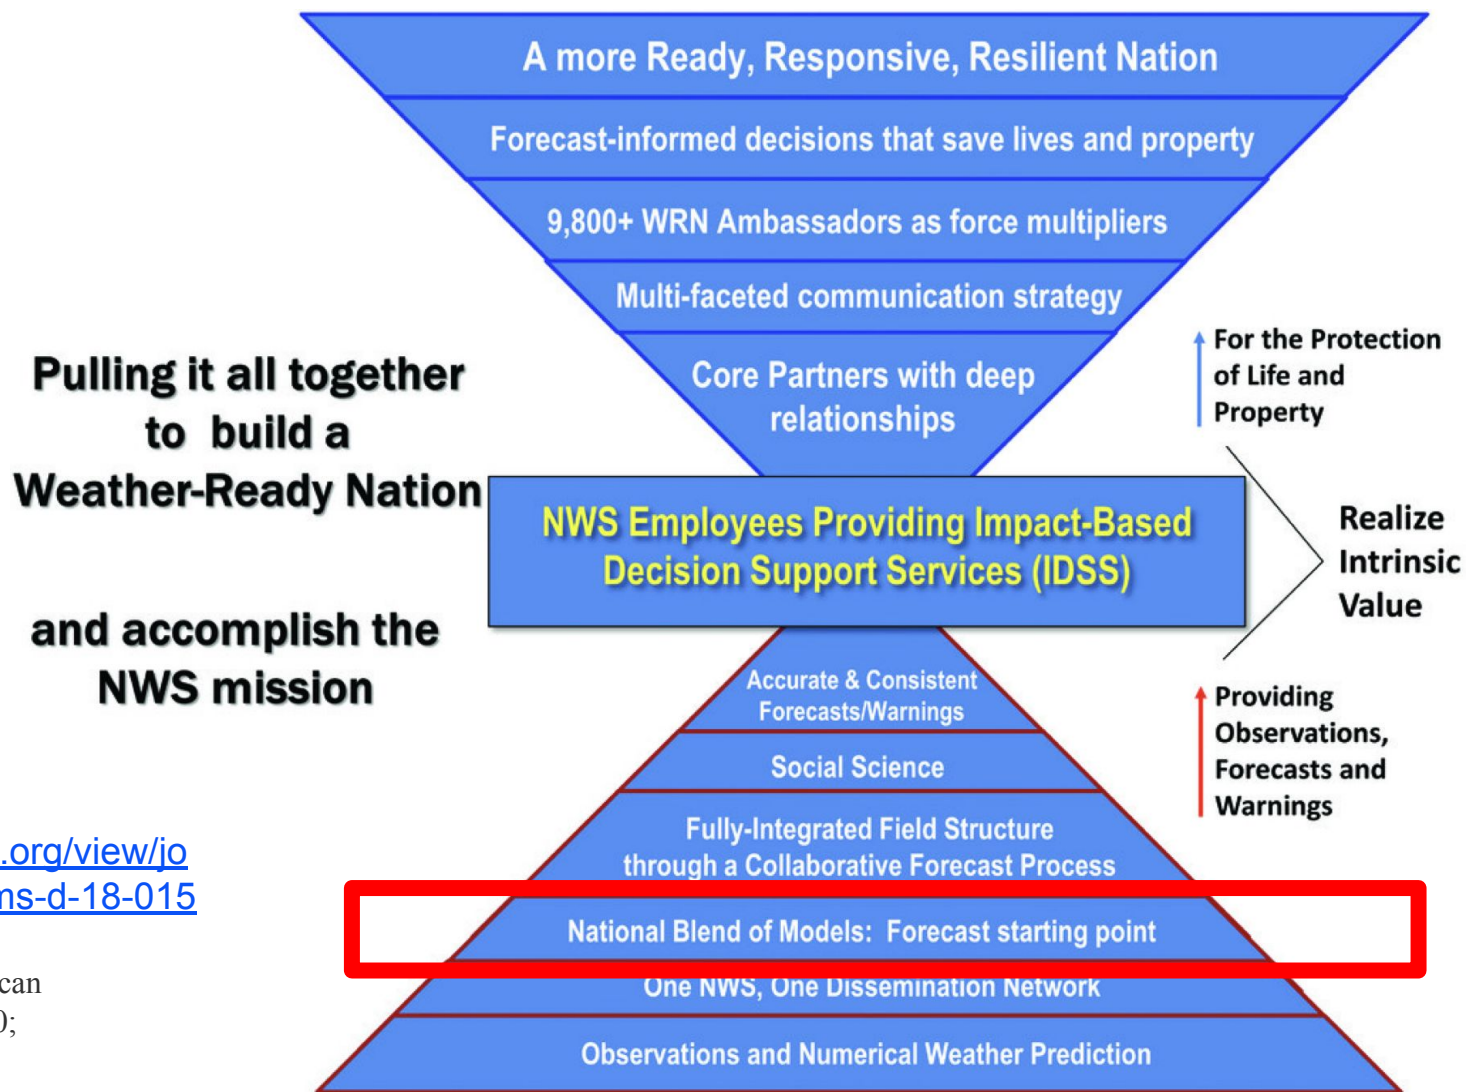

April, 2023

The opinions expressed in this presentation are the author's and are not necessarily the view of any federal office or agency.

The National Blend of Models (NBM) is a nationally consistent and skillful suite of calibrated forecast guidance based on a blend of both NWS and non-NWS numerical weather prediction model data and post-processed model guidance.

The goal of the NBM is to create a highly accurate, skillful and consistent starting point for the gridded forecast.

Updated: Dec 19, 2022

# Topics

- NBM v4.1 Implemented January 2023
- New 24-hour probabilistic Maximum wind forecasts in NBM v4.1
- Additional post-processing added to NBM v4.1 hourly winds to address low bias
- Digital Aviation Services cloud fields
- What's next?

# NBM v4.1 Introduces Probabilistic Maximum Daily Wind

## Inputs:

~200 direct model output solutions/members from GFS, HREF, SREF, FNMOC, ECMWF, CMC, ACCESS

## Bias correction and downscaling:

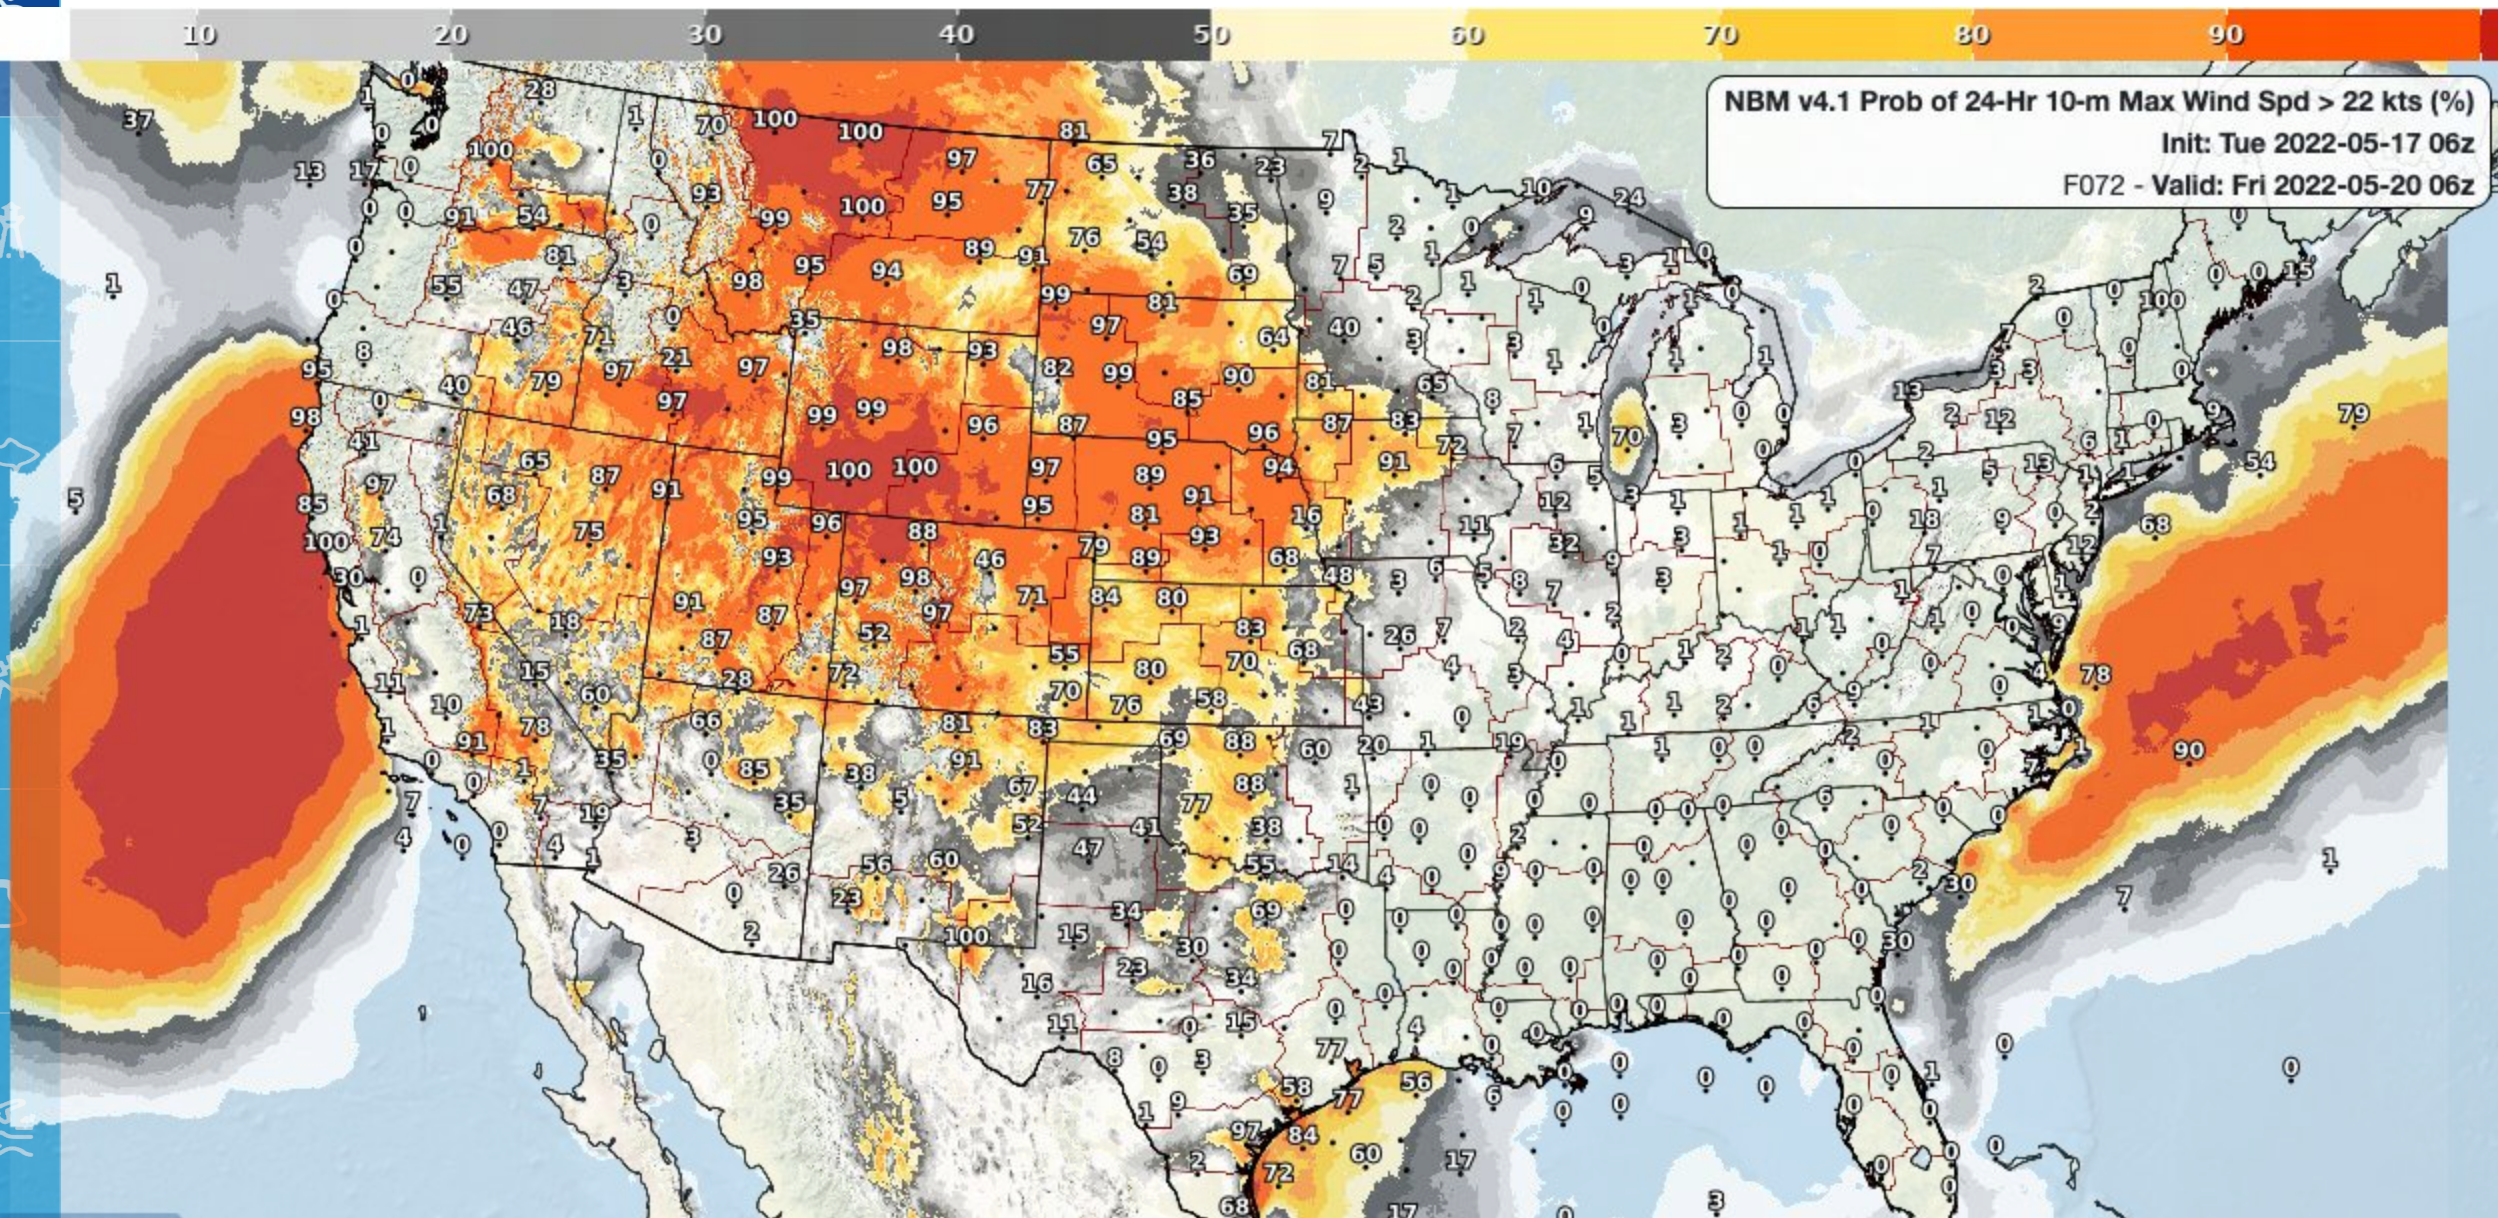

Quantile mapping based on fitted gamma distribution from previous 120 days of forecasts and observations

If a model forecast is at the 90th percentile of the fit model distribution, it gets bias corrected to the 90th percentile of the fit observation distribution

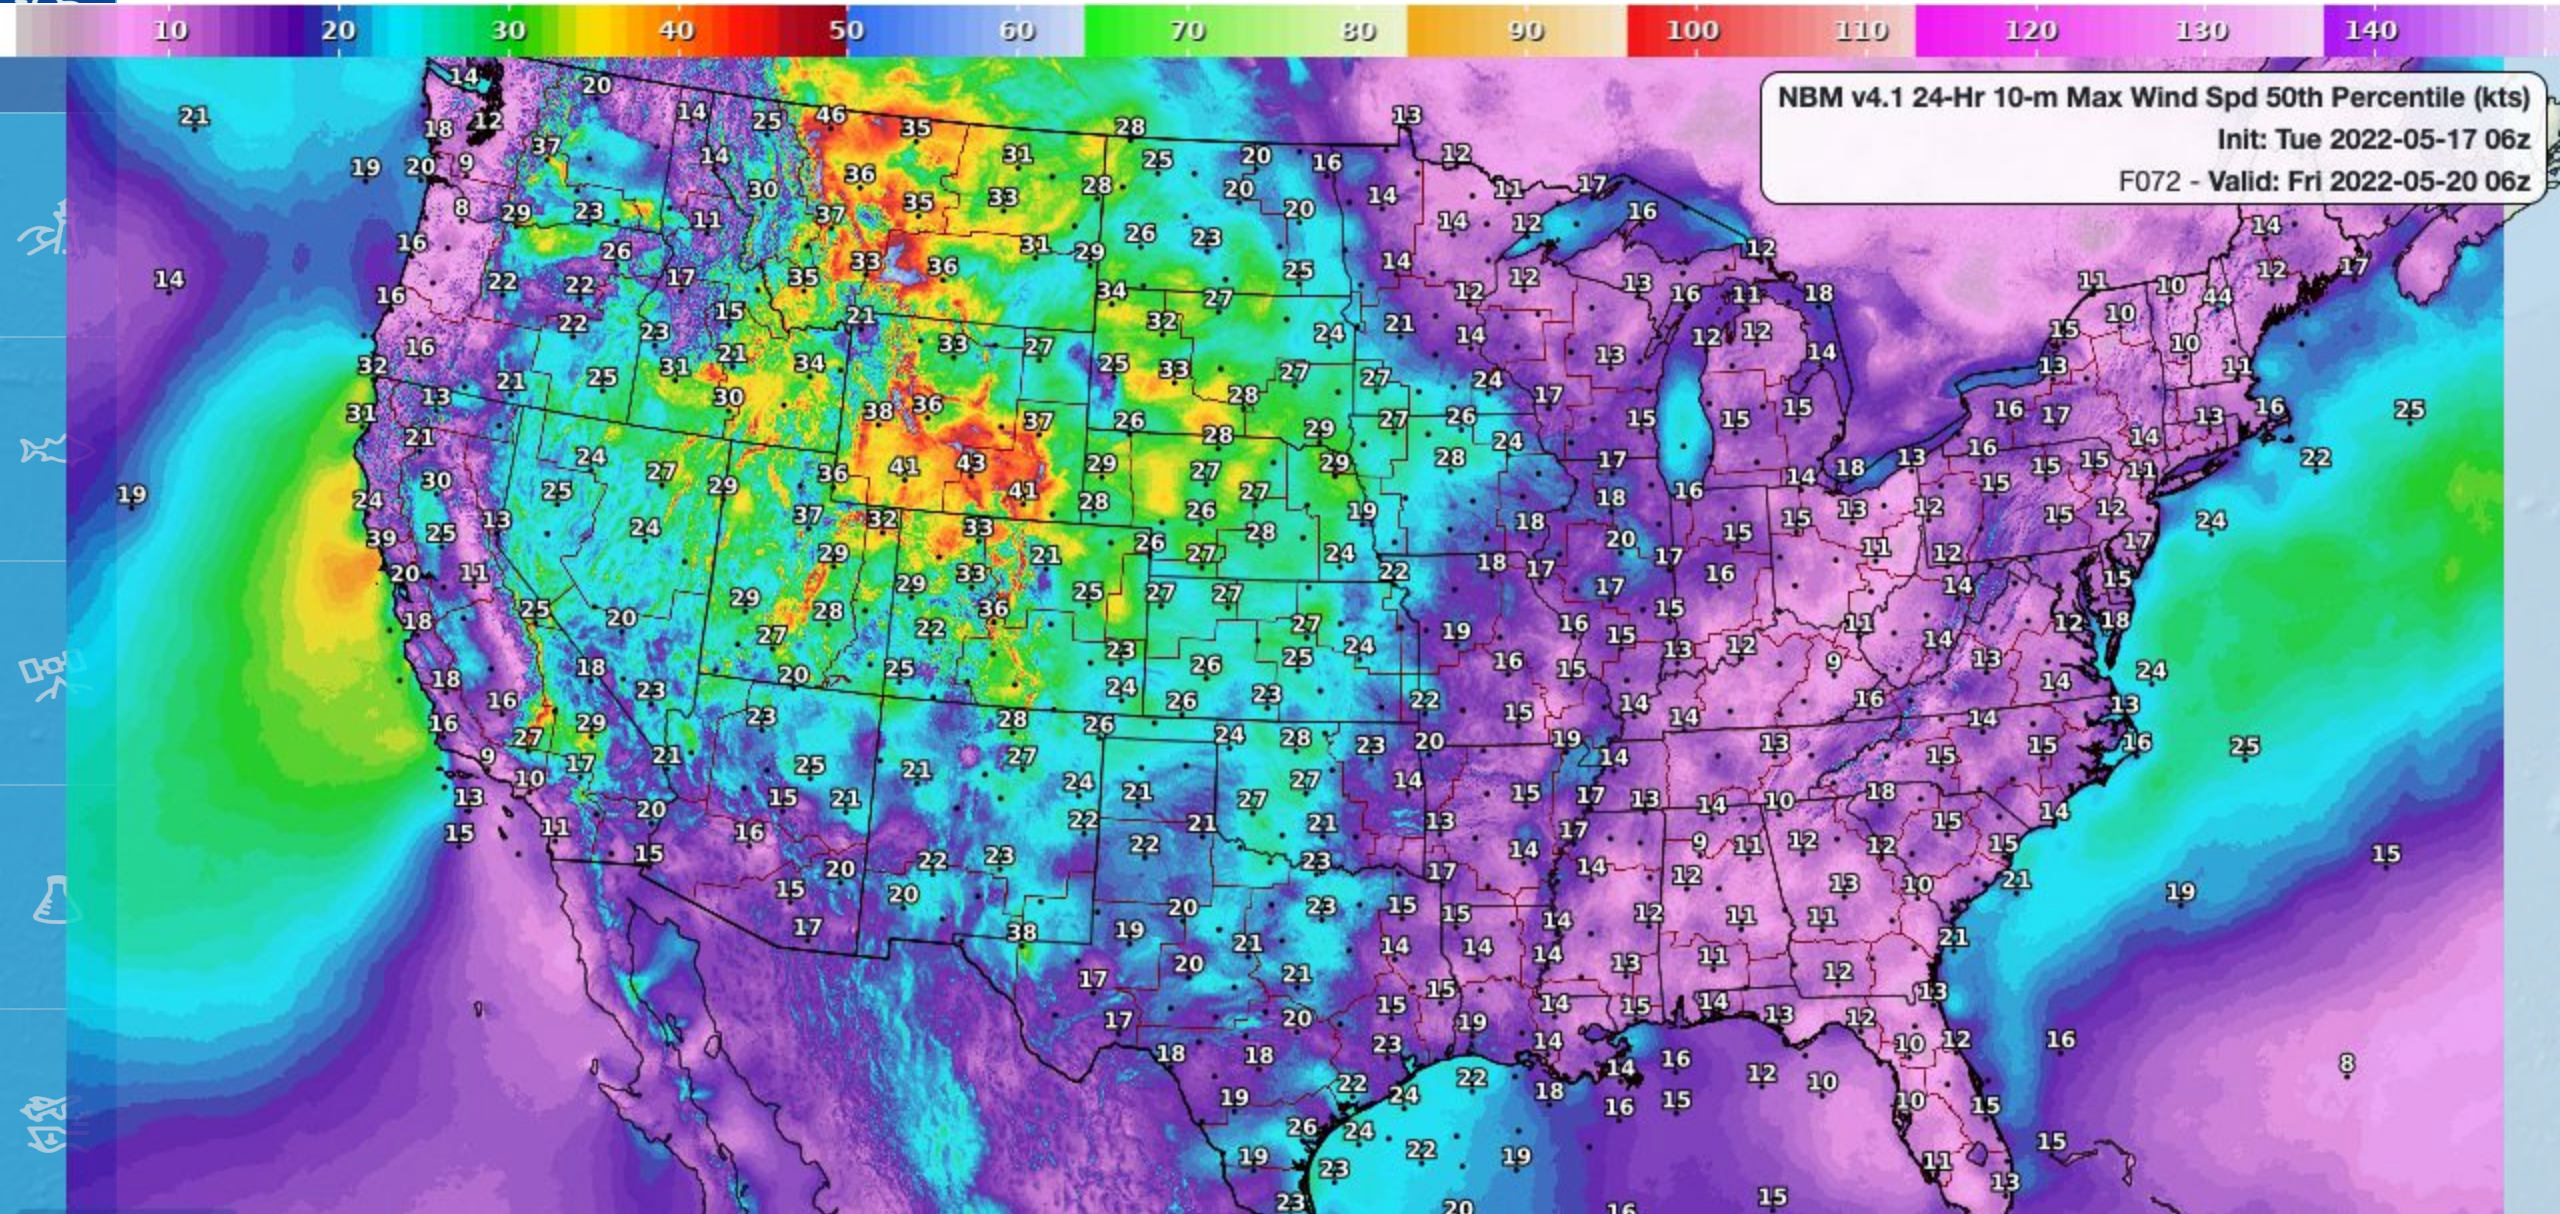

## Output:

Percentiles from 1-99 and model relative frequencies of exceeding thresholds (wind: 11, 17, 22, 34, 48, 64 kts; gust: 22, 34, 41, 48, 56, 64 kts)

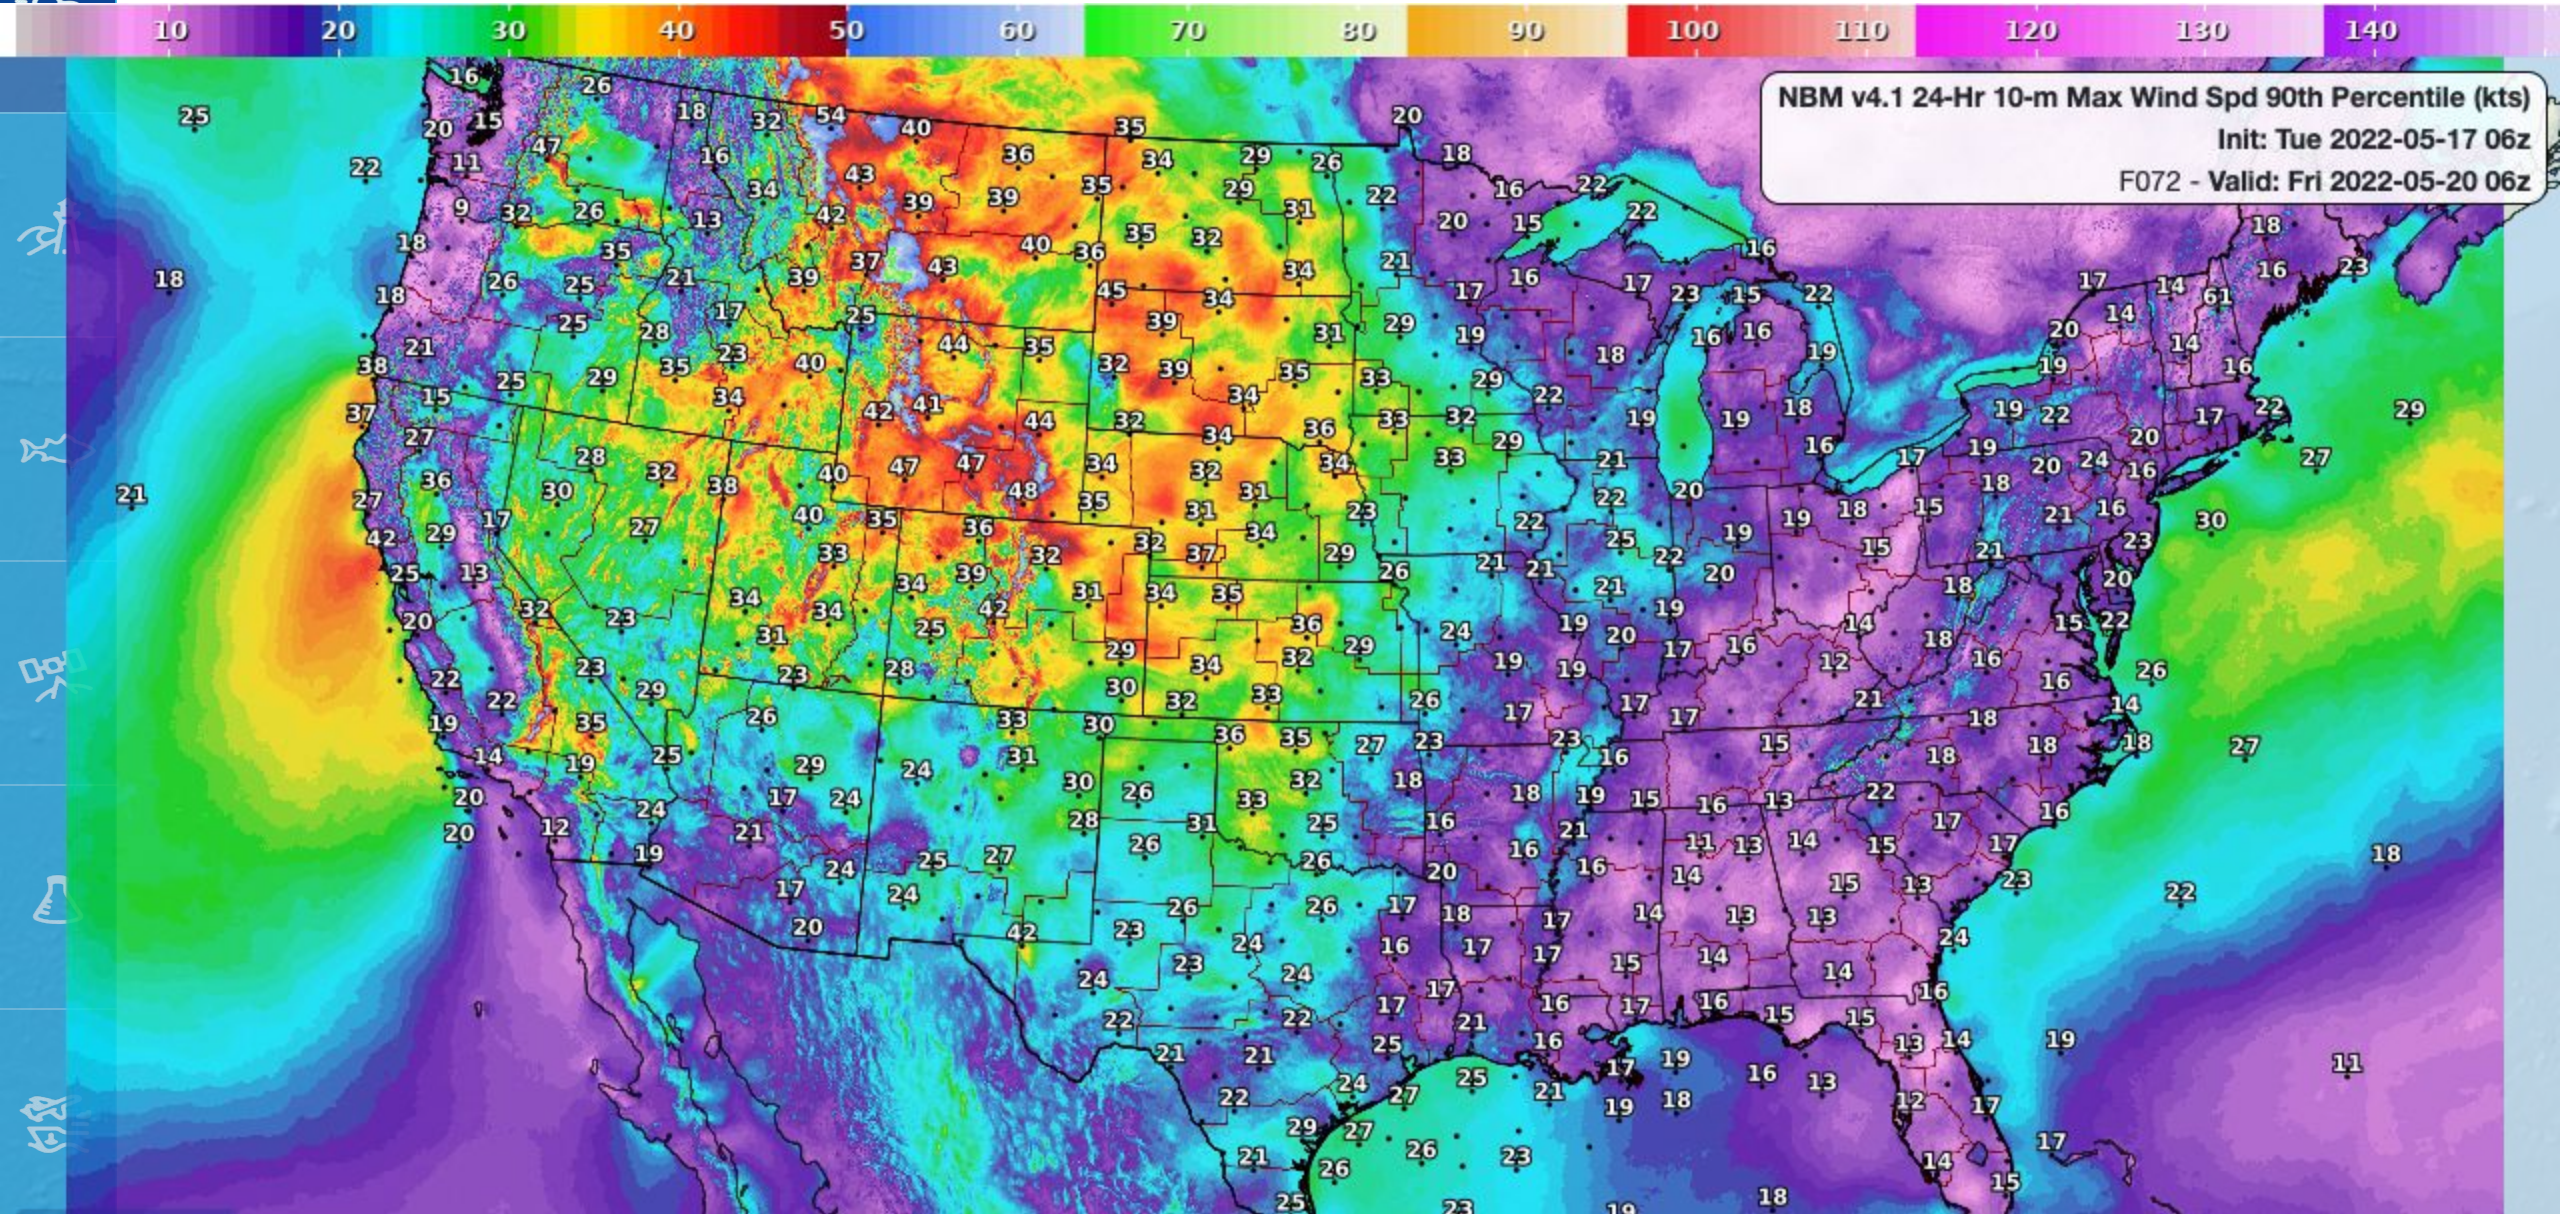

# Probability of wind exceeding 22 knots

# 50th Percentile (Median)

# 90th Percentile

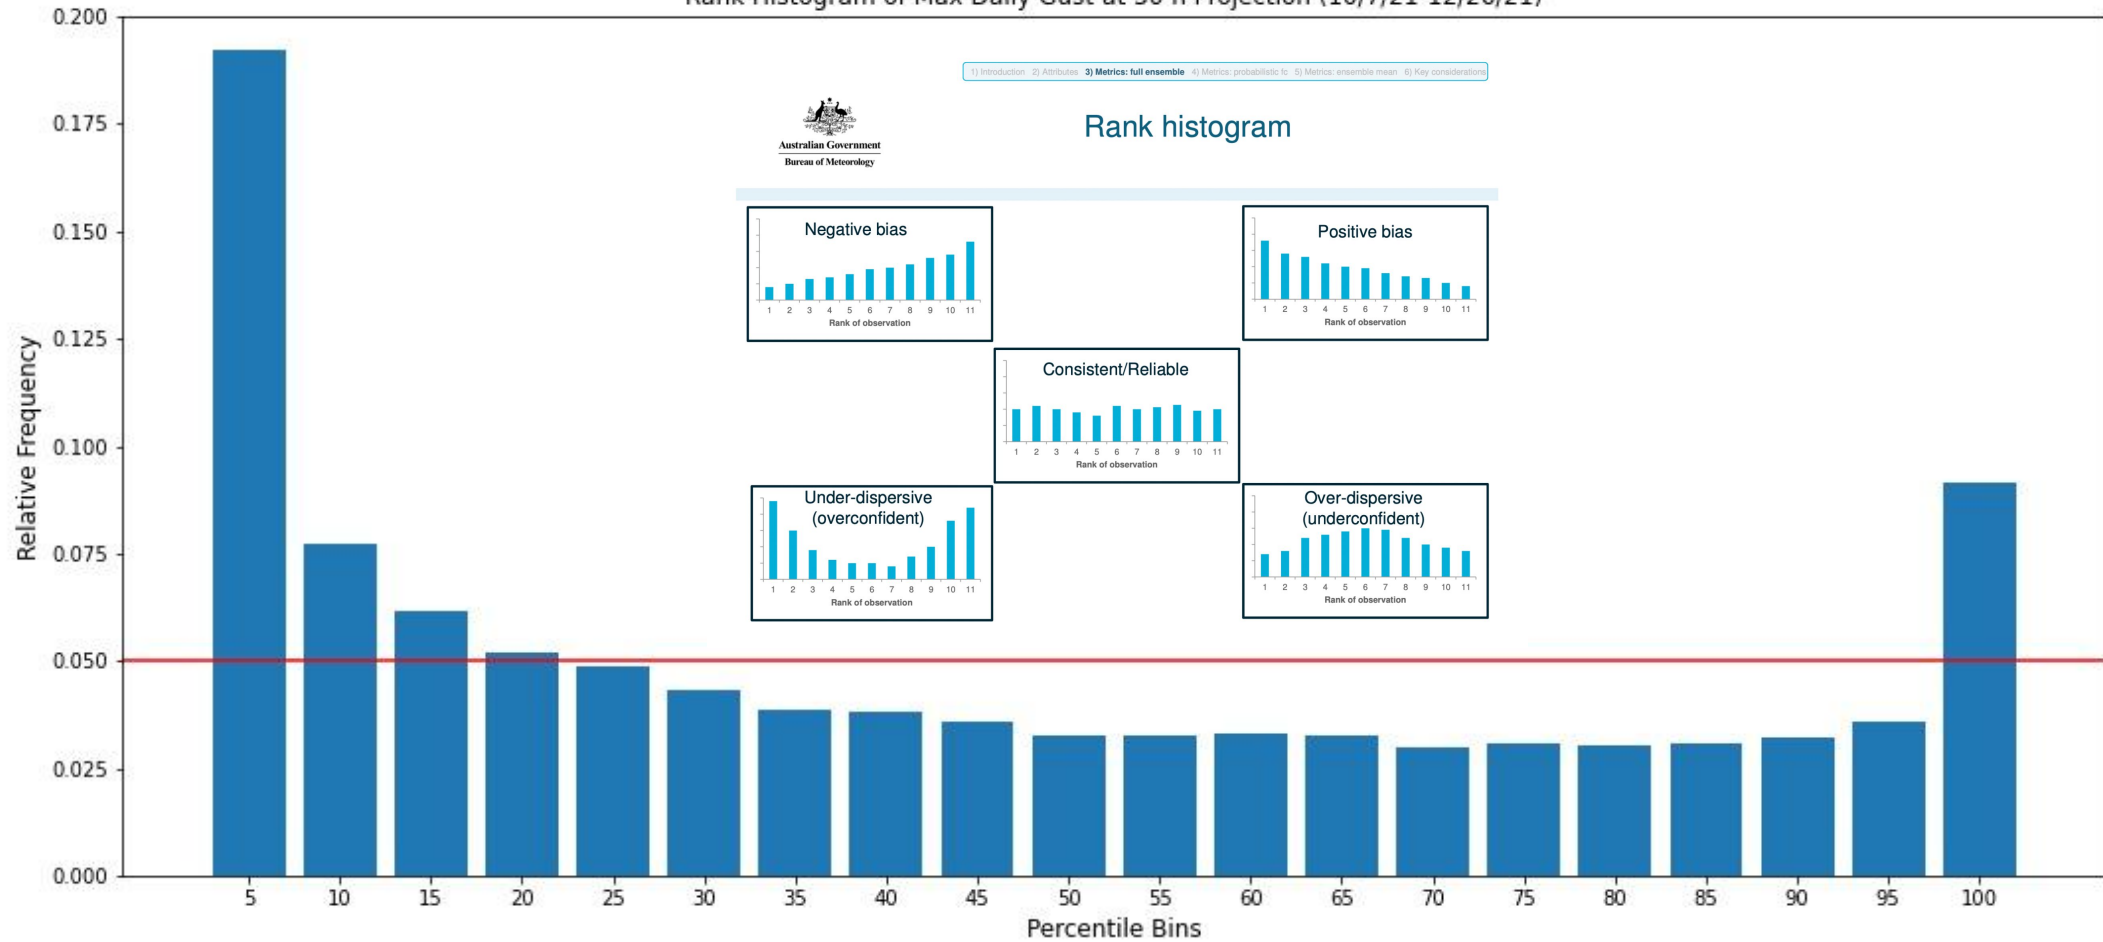

# Gust Forecast Reliability Day 1

Rank Histogram of Max Daily Gust at 30 h Projection (10/7/21-12/26/21)

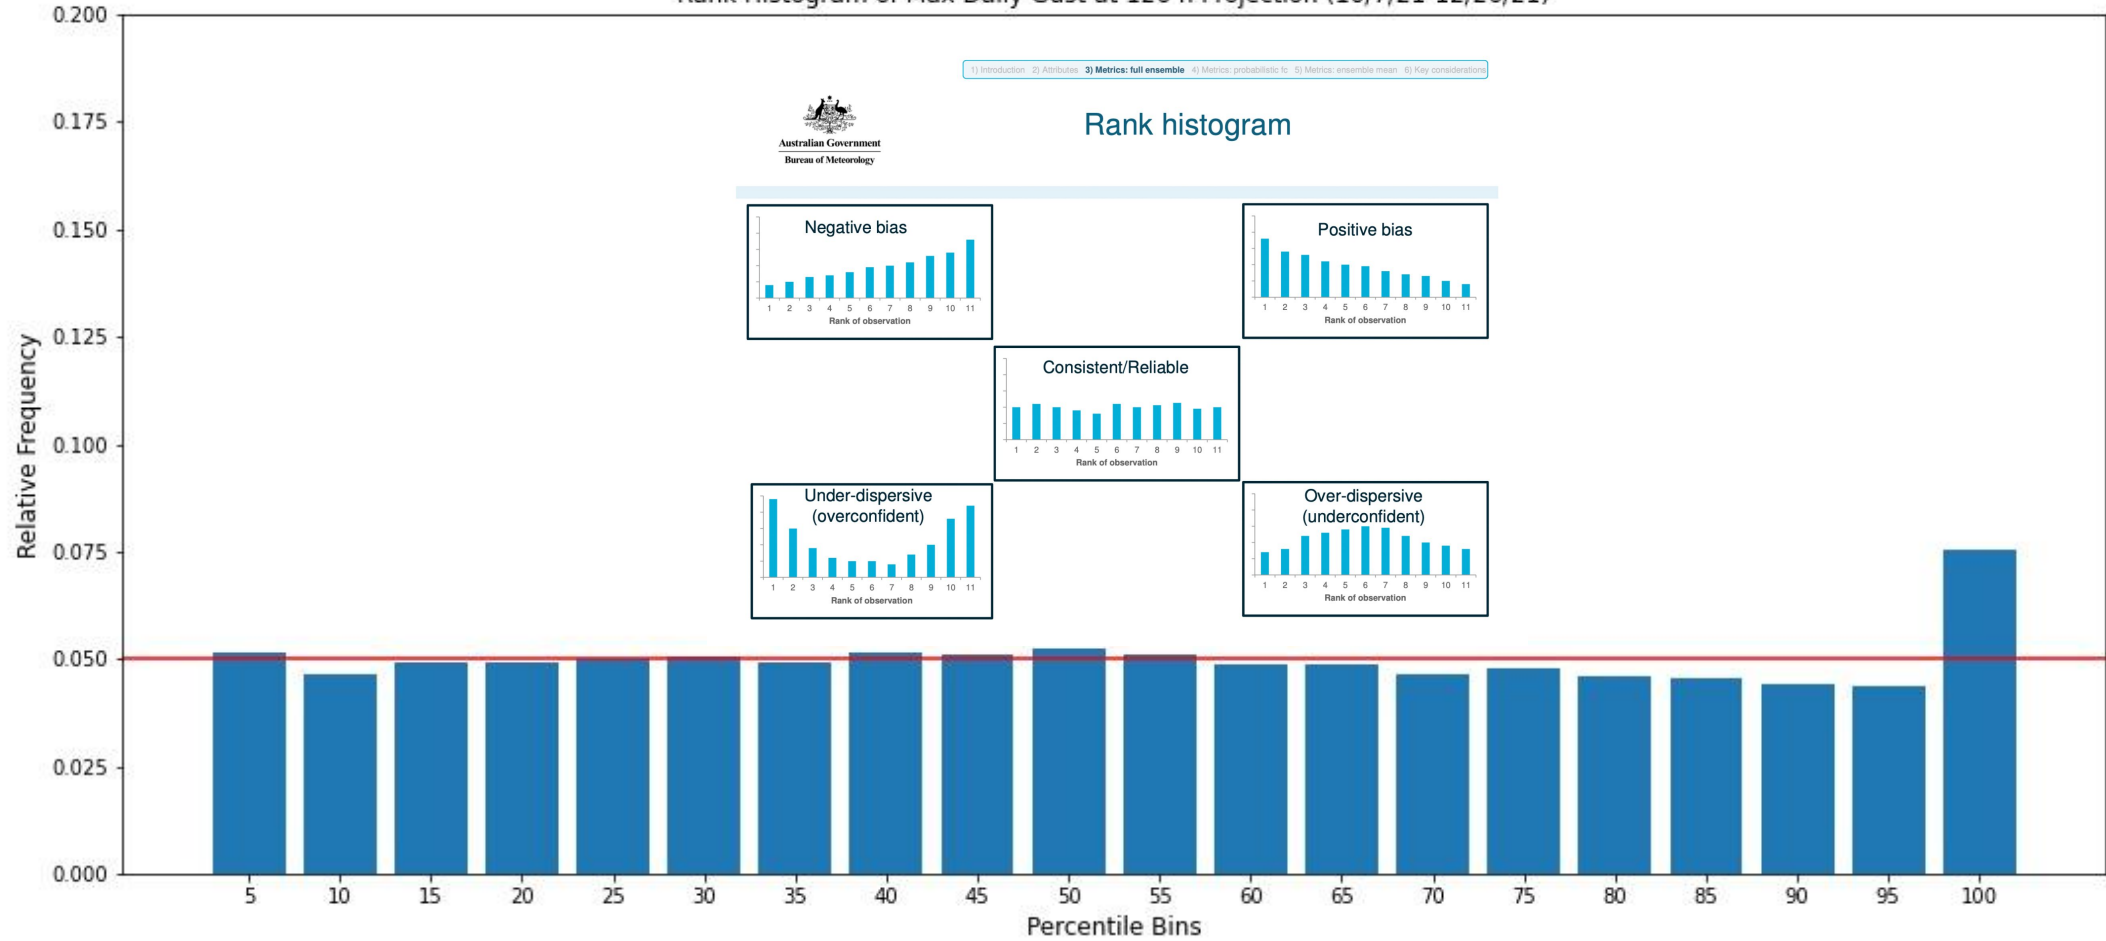

<https://www.ecmwf.int/sites/default/files/elibrary/2017/17626-ensemble-verification-metrics.pdf>

# Gust Forecast Reliability Day 5

Rank Histogram of Max Daily Gust at 126 h Projection (10/7/21-12/26/21)

<https://www.ecmwf.int/sites/default/files/elibrary/2017/17626-ensemble-verification-metrics.pdf>

# Hourly Winds blend v4.0

1. Bias correct the model solutions based on analyzed truth (URMA)
2. Create weighted average, where models that had lower mean absolute error (MAE) over recent period have higher weight.

Called MAE weighted forecasts

NBM v4.0 has low bias for wind speeds and gusts, especially for events above 20 knots

# NBM v4.1 MOS postprocessor

Add the same postprocessing step that has been used in GFS-MOS

## Techniques

Linear regression: leverage static training period to develop relationship between v4.0 MAE forecasts and observations

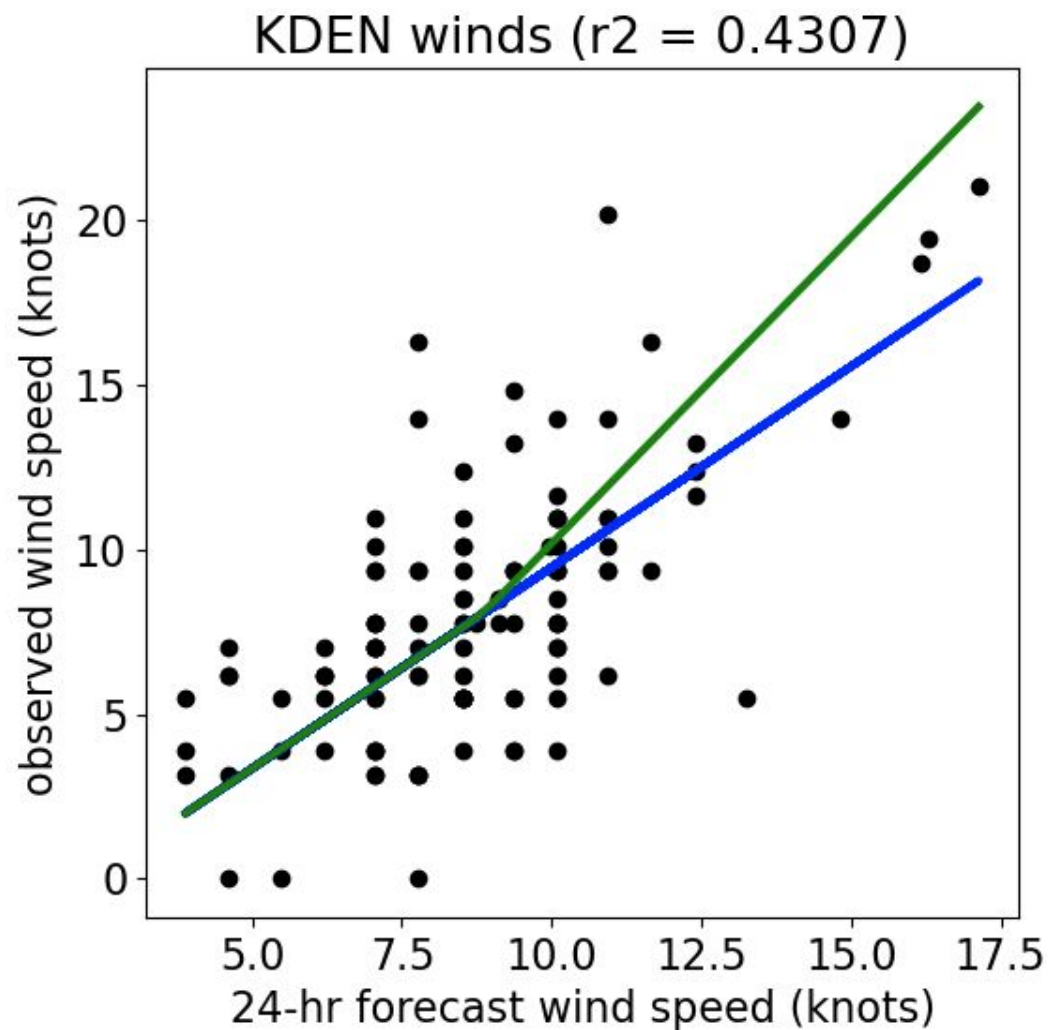

Partial inflation: Increase forecasts above the mean observation

# NBM v4.1 MOS postprocessor on winds

blue: linear regression model

green: linear regression model + partial inflation

partial inflation based on correlation and mean observations

# Verification - Contingency Tables

		10 <=	20 <=	30 <=	40 <=	ob >=					10 <=	20 <=	30 <=	40 <=	ob >=

fcst >= 50	5	2	6	12	13	34	72		fcst >= 50	0	0	0	0	0	0	0
	192486	44079	4507	498	70	39	241679			192486	44079	4507	498	70	39	241679

# Three Cloud Layers for Digital Aviation Services (DAS)

- 
- 
- 
- 
- 
- Cloud layer data derived from RAP cloud fraction
  - Three cloud bases (heights of bottom of cloud layer)
  - Three cloud tops (height of top of cloud layer)
  - Three cloud amounts (coverage of cloud layer)
  - AWC (DAS) logic

# Sky and Ceiling

- All Cloud fields are informed by Gridded LAMP Ceiling.
- If GLMP Ceiling: Sky  $\geq$  57%
- Digital Aviation fields have same ceiling as GLMP

# Take Away

- NBM v4.1 hourly winds are generally stronger than 4.0; We are aware of artifacts introduced in v4.1, especially over water.
- New max 24-hour probabilistic winds support IDSS
- New DAS cloud layer fields are available
- NBM Sky cover is no longer used to remove ceilings (ceiling from GLMP is retained)

# What's Next?

- Model Input consolidation around UFS (GFS and RRFS)
- Range of hourly wind forecasts instead of single value
- Software optimization
- Additional model calibration

# Thank You

Adam Schnapp (NBM Aviation Lead)
